FIGURE 3

Stratigraphic sections and facies relations of Carboniferous and Permian rocks, northern Axel Heiberg Island to central western Ellesmere Island

Paleontological information on all figures includes only identification of foraminifera and ammonoids. The foraminifera identified in samples of cuttings have limits referred to in text.

Covered intervals of less than 20 feet are not indicated.

The uncharacteristic occurrence of Carboniferous and Permian rocks in these islands may be attributed to the influence of the Eurekan Orogeny. Detailed study of facies, stratigraphic sections and the paleontological evidence, indicate a few relative transitions.
