

- 32** Diabase, quartz diabase, gabbro, diorite
- 28** ET-THEN GROUP: conglomerate, sandstone, quartzite
- 27** Granite, granodiorite, diorite, syenite, porphyritic (quartz and feldspar) felsites
- 19** GREAT SLAVE GROUP (Uppart Part)-STARK, TOCHATWI, and PEARSON FORMATIONS: dolomite, limestone, shale, argillite, sandstone, andesite, basalt, trachyte
- 17** NONACHO GROUP: arkose, quartzite, slate, greywacke, conglomerate; minor volcanic rocks, phyllite and schist
- 14** GREAT SLAVE GROUP (Lower Part)-SOSAN, KAHOCHELLA, and PETHEI FORMATIONS: conglomerate, sandstone, quartzite, shale, slate, argillite, arkose, limestone, dolomite, tuff, breccia, agglomerate, andesite, iron formation
- 13** Granodiorite, granite, quartz diorite, syenite; includes some gneissic rocks; 13c, may include Proterozoic granitic rocks
- 12** Impure and gneissic granitic rocks, sedimentary and volcanic schist and gneiss, mixed sedimentary and granitic schist and gneiss, migmatite, mylonite. May include minor Proterozoic rocks
- 7** TAZIN GROUP: andesite, dacite, rhyolite, tuff, agglomerate, greywacke, arkose, quartzite, argillite, slate, limestone, quartz-mica schist
- 4** Hornfels, nodular quartz-biotite schist, quartzite, siliceous argillite, minor paragneiss and migmatite
- 1** Basalt, andesite, tuff, agglomerate, chert, breccia; derived schist and gneiss; minor dacite and rhyolite

Geochemical Symbols and Data Presentation

The concentration of an element at a sample site is graphically presented by using one of 15 symbols, if a sample was collected but no relevant data is available a dot is plotted. The symbols are divided into 2 groups of 7 respectively, and one additional symbol. The first 7 increase in size from a small cross to a large open circle. The eighth symbol, the additional one, consists of the large open circle with a dot at its centre. In the last 7 symbols the dot becomes progressively larger until a solid black circle is reached, a circumscribed square in solid black is used for the last symbols. Thus the overall impression is of increasing size and blackness as samples display from low to high elemental content.

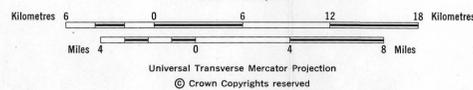

The data distributions are depicted using both a cumulative probability plot and a histogram. It should be noted that if the survey covers several map sheets the distribution displays are for the total survey data, not the single sheet being studied. The data intervals used for the histogram are semi-logarithmic, e.g. 1,2,5,10,20,50,100 etc., due to the apparent log-normal characteristic of most trace element distributions. The symbols cover 5 decades, e.g. 1 ppm to 10%, using the above data intervals. As this map is part of a Canada wide series these arbitrary intervals have been chosen to preserve some long-term continuity, however, based on experience at the Geological Survey, we believe them to be an appropriate compromise.

For any particular element the eighth, central, symbol is ascribed to the histogram mode. The median of the data distribution, as defined by the 50% (0.5) point on the cumulative probability plot, usually falls within the mode interval of the histogram. The symbol (+) and (x) are respectively used to display concentrations below and at the analytical detection limit. To illustrate the use of the symbols an example is given below. If the actual data distribution does not require all 15 symbols some are selectively dropped so that maximum overall graphic impact is maintained.

This map forms one of a series of 42 sheets released
 under Geological Survey of Canada Open File 326. The open
 file consists of data for 12 elements, percent loss on
 ignition and sample site location, each variable requiring
 3 sheets for the total survey area.

The data is also available in digital form from the
 Computer Science Centre of the Department of Energy, Mines
 and Resources: For further information please contact:
