CATALOGUE OF THE CANADIAN NATIONAL METEORITE
COLLECTION LISTING ACQUISITIONS
TO MARCH 31, 1963

INTRODUCTION

The catalogue of the Canadian National Meteorite Collection was compiled as a result of the recent resurgence of interest in meteorites. This has been created by outer space research and the development of instruments having new capabilities for analyzing such materials. The collection, which had its beginnings late in the 19th century, has grown to a total of 250 falls. These include 21 of the 26 known Canadian meteorite falls. Weights of individual meteorite falls range from 150 kg (350 lbs.) to a fraction of a gram. The acquisition of new falls has increased recently because of the availability of the Abee enstatite chondrite for exchange purposes.

The catalogue is organized alphabetically on the basis of the accepted geographically derived names of the falls beginning with the Abee, Alberta chondrite and ending with the Zavid, Yugoslavian chondrite. The tektite holdings are listed separately at the end. The individual falls are described in the following manner: geographical locations, time of fall or recovery, class, weight and form of specimen in the collection, and a selected reference. Every effort was made to provide complete and accurate reference, but, a few of the older references could not be verified.

Grateful acknowledgment is made of the valuable assistance provided by Drs. P. Millman and Brian Mason. Geographical sources and other pertinent information was obtained from their publications and from those of H. Brown, G. Kullerud, and W. Nichiporuk and M. Hey.
