

Figure 2  
Columnar sections of wells illustrating facies changes and probable correlations between the Devonian deposits of the central and southern Alberta Plains. These sections show the correlation of the basin and reef deposits of the Woodbend Group with the reef complexes along the shelf margin and the shelf deposits. Attention is drawn to the intertonguing of the low reefs of the last stage of the Woodbend reef growth and the Ireton off-reef shale deposits (Based on data available, March, 1955)

Note: 1. The term Cairn formation has been inserted just prior to publication to co-ordinate terminology of Belyea and McLaren, A. S. P. G. Field Guide Book, 1955, with this material. The use of the term Cairn formation south of Socony Gulf Amerada Wimbome No. 1 well necessitates an arbitrary cut-off of the term Cooking Lake formation between this well and Husky Phillips Pine Lake No. 1 well
