LÉGENDE

LEGEND

HADRYNIAN (UPPER PROTEROZOIC) OR YOUNGER

DIABASE

NEOHELIKIAN (LATE MIDDLE PROTEROZOIC) AND OLDER

21 Coarse-grained, massive, biotite-pyroxene gneiss and alkali syenite, pink to grey in colour; 21a, biotite gabbro; 21b, mica pyroxenite and related ultrabasic rocks

20 PINK GRANITE

Coarse-grained, homogeneous, pink, biotite granite; 20a, fine-grained, buff alkali granite with soda amphibole and soda pyroxene

19 MIGMATITE

Poorly foliated intermixed migmatite rocks (20) and other gneisses

PALADELIKIAN (EARLY MIDDLE PROTEROZOIC?) AND OLDER

PORPHYRITIC QUARTZ MONZONITE

Coarse-grained, porphyritic quartz monzonite and monzonite with derived cataclastic gneiss and minor hornblende diorite; 18a, related biotite augen gneiss

17 MANGERITE

Green to brown, coarse-grained, homogeneous, locally norryritic and garnetiferous

16 ANORTHOSITE

Coarse-grained, homogeneous, massive to cataclastic anorthosite, grey, brown or mica in colour; 16a, related metabasic gabbro and leucocratic gabbro

15 GABBRO AND META-GABBRO

Dark, homogeneous, massive gabbro and meta-gabbro, probably not all of one age

14 GREEN-ROCK COMPLEX

Undescribed mafic and related intrusive rocks (15-17), granulite (5-7), gneiss and intercalated metasedimentary facies (8-13), all metamorphosed to granulite facies and not separable at many scale

APHERIAN (LOWER PROTEROZOIC)*

13 GRENVILLE SERIES (8-13)

Layered metasedimentary sequence containing quartzite (9), or marble (11), or aluminous biotite gneiss (8), each considered diagnostic of the Grenville Series

12 LEUCOCRATIC GNEISS

Dark, medium-grained, hornblende-plagioclase gneiss, amphibolite, and pyroxene amphibolite, lithologically indistinguishable from unit 2

11 MARBLE

Predominantly marble and calc-silicates, white or grey in colour, and medium to coarse grained

10 WHITE ROCK

White rock, white pegmatite, white granite, and many pyrite and graphite gneisses, all characterized by predominantly white colour and being genetically related to marble (11)

9 QUARTZITE

Predominantly quartzite, white to grey, homogeneous, and vitreous

8 BIOTITE GNEISS

Predominantly layered quartz-felspar-biotite paragneiss with garnet, staurolite, tourmaline, or byssomite

7 MAFIC GRANULITE

Dark gray to black, fine- to medium-grained, granulite, homogeneous, massive, or less commonly streaky, and containing hornblende and/or hypersthene and clinopyroxene

6 LEUCOCRATIC GRANULITE

Homogeneous, massive to streaky, euhedral and locally cataclastic

5 CATACLASTITE

Leucocratic, pink, grey or buff, fine- to medium-grained, homogeneous, streaky, cataclastic granite gneiss, associated with and grading into unit 6

4 PYROXENE-HORNBLende GNEISS

Dark, medium-grained, streaky, two-pyroxene - hornblende gneiss (granulite

3 CHARCOCITIC GNEISS

Leucocratic, medium-grained, equigranular charcocitic gneiss characterized by brown weathering green perthitic feldspar, biotite, hypersthene, and minor hornblende, clinopyroxene, or garnet

2 HORNBLende GNEISS

Leucocratic, medium-grained, grey hornblende-plagioclase gneiss and amphibolite with biotite and minor clinopyroxene or garnet, same lithology as 12; layered, leucocratic, grey, garnet-biotite-hornblende gneiss

1 GRANITE GNEISS

Leucocratic, medium-grained, pink to grey, equigranular biotite and garnet-biotite paragneiss, typically layered and well foliated; 1a, grey biotite-hornblende-oligoclase gneiss, leucocratic, foliated, and totally streaky

Examined outcrop.....

Geodetic boundary (approximate).....

Geotextility (inclined, vertical, dip unknown).....

Stratiform foliation (inclined, vertical, dip unknown).....

Mylonite lamination (inclined, vertical, dip unknown).....

Lineation (direction and plunge).....

Quarry or open prospect (active, possibly active).....

Glacier drift.....

Lower metamorphic isograd (marking disappearance of muscovite, epidote, and tremolite from rocks of appropriate composition).....

Upper metamorphic isograd (marking appearance of hypersthene, brown hornblende, and green perthitic feldspar (granulite facies) in rocks of appropriate composition).....

Corrected metamorphic isograd (marking limit of the changes described above).....

K-Ar age determination (10^6 years).....

MINERAL OCCURRENCES

Copper..... Cu

Lead..... Pb

Dolomite..... dol

Magnete..... mag

Porcelaine..... por

Feldspat..... fel

Marble..... mar

Serpentine..... serp

Garnet..... gt

Mica..... mi

Silice..... sc

Graphite..... gf

Molybdenite..... Mo

Staurolite..... st

Talc..... tal

Bismuth..... bl

Nickel..... Ni

Talc..... tal

Iron..... Fe

Radiative minerals..... ra

Zinc..... Zn

Kaolinite..... kaol

Project coordination and geological mapping with aircraft, 1964, H. R. Wyne-Edwards and A. F. Gregory

Geological mapping, Kempt Lake area, 1964, E. W. Reinhardt (party chief) C. A. Giovannella, V. H. Becker

Geological mapping, Mont-Laurier area, 1964, P. W. Hay (party chief) A. C. Brown, C. H. Nixon

With additional information from D. T. Anderson, R. F. Embley, and E. H. Gaucher, 1964 and from maps of part of the area published by the Quebec Department of Natural Resources

Compiled by H. R. Wyne-Edwards, A. F. Gregory, 1965

Geological information drawn by H. R. Wyne-Edwards, 1965

Road.....

Crest track.....

Trail or portage.....
