This map has been compiled from digitally recorded high-sensitivity aeromagnetic data obtained by two self-orienting rubidium-potassium magnetometers installed in twin tail-booms mounted on the Cessna Beechcraft 850 aircraft. The magnetometers are vertically separated by a distance of 2.08 metres with each measuring the total magnetic field to a resolution of 0.02 gammas.

Flight altitude was 150 m above ground at 300 m average flight line spacing. Double control lines were flown at an average spacing of 15 kilometres.

The vertical gradient values, which approximate closely to the first vertical derivative of the earth's total field, are obtained by dividing the difference between the total field readings of the two magnetometers by their vertical separation.

The vertical gradient data was filtered with a digital operator to remove instrument noise. The vertical gradient data from the control lines was not used in the compilation of the map. The data was edited, compiled, gridded and gradient values for contouring interpolated onto a square grid (0.25 km grid spacing at the published map scale) by automatic computer processing. The gridded data was contoured and printed using a computerized contouring program and digital plotter facilities of Dataflex Services Ltd. The survey data used to compile this map is available in digital form from the Geological Survey of Canada at the cost of retrieval and copying.

Airborne survey and digital compilation was carried out by Resource Geophysics and Geochemistry Division, Geological Survey of Canada. The survey operations took place in August and September 1977 using Beechcraft Queeny 85-B80 aircraft CF-W20.

The topography for this map was reproduced from 1:50,000 topographic map sheets, published by the Department of Energy, Mines and Resources.

Copyright of this map may be obtained from the Saskatchewan Department of Mineral Resources, Regina, or from the Geological Survey of Canada, Ottawa.
