

MAP 114G

—
ROSAIRE

L'ISLET AND MONTMAGNY COUNTIES

QUEBEC

Scale: One Inch to One Mile = $\frac{1}{63,360}$
Miles

A horizontal number line starting at 0 and ending at 3. There are tick marks at integer intervals: 1, $\frac{3}{4}$, $\frac{1}{2}$, $\frac{1}{4}$, 0, 1, 2, and 3. The segments between the tick marks represent equal intervals of length 1/4.

Magnetic Survey, November 1951 and April 1952,
by Geophysics Section, Geological Survey of Canada,
Department of Mines and Technical Surveys.

No correction has been made for regional variation.

The magnetic data on this map were compiled from information recorded along the flight lines shown. The anomalies expressed by the magnetic contours are dependent on the variable magnetic intensities of the underlying rocks, and may be due to conditions near, or at unknown depths below, the surface. High magnetic anomalies normally indicate the presence of basic rocks, such as diabase, gabbro, or serpentine, which have a relatively high iron content; but in special instances may be due, or partly due, to concentrations of magnetic ore minerals. By means of the magnetic anomalies, various rock bodies or structural features, such as faults or folds, may be traced by the geologist into, or across, areas where few or no outcrops. In many instances, however, no interpretation of particular anomalies may be possible without further geological information.
