Magnetic depression	
Flight lines	

Flight altitude: 375 m above sea level.
NOTE: Fiducials over water are interpolated by computer based on recorded VLF navigation.

This map is based on digitally-recorded high-sensitivity aeromagnetic data obtained with a Sander NPM-5 proton precession magnetometer which measured the total magnetic field to a resolution of .05 gamma. Flight altitude was 375 m ASL at 400 m average flightline spacing and control lines were flown at an average spacing of 10 km.

The data was edited, compiled, levelled and gamma values for contouring interpolated on a square grid (2.54 mm grid spacing at the published map scale) by automatic computer processes.

Magnetic data was corrected for changes in the earth's magnetic field with time using a ground station at Sydney airport. Control lines were used to eliminate systematic errors through analyzing and correcting of differences at intersections between traverses and control lines. No correction has been made for regional variations of the earth's magnetic field.

Airborne surveying, digital compilation, automatic contouring and plotting was carried out by Sander Geophysics Limited. Flying took place in October and November 1976.

Copies of this map may be obtained from the Nova Scotia Department of Mines, Halifax, or from the Geological Survey of Canada, Ottawa. The data represented by these maps is available in digital form from the Geological Survey of Canada at the cost of retrieval and copying.
