Airborne magnetic survey, Aug 1968 to Oct 1969,
 by Aero Photo Inc.

No correction has been made for regional variation.

The planimetry for this map was obtained from
 advance information supplied by the Department
 of Energy, Mines and Resources.

The magnetic data on this map were compiled from information recorded along
 the flight lines shown. The anomalies expressed by the magnetic contours are de-
 pendent on the variable magnetic intensities of the underlying rocks, such as diabase, gabbro,
 or serpentinite, which have a relatively high iron content; but in special instances may
 be due, or partly due, to concentrations of magnetic minerals. By means of the
 magnetic anomalies, various rock bodies or structural features, such as faults or
 folds, may be traced into, or across, areas of few or no outcrops. In many instances,
 however, no interpretation of particular anomalies may be possible without further
 geological information.
