Airborne Magnetic Survey by Geoterra Limited, from
Sept. 1969 to June 1970.

Survey flown with a helicopter owned by Klondike Helicopters
at an average speed of 90 m.p.h.

The topography for this map was obtained from
topographical map sheets published by the
Department of Energy, Mines and Resources, Ottawa.

No correction has been made for regional variation.

The magnetic data on this map were compiled from information
recorded along the flight lines shown. The anomalies expressed by the
magnetic contours are dependent on the variable magnetic intensities of
the underlying rocks, and may be due to conditions near, or at unknown
depths below the surface. High magnetic anomalies normally indicate the
presence of basic rocks, such as diabase, gabbro, or serpentinite, which
have a relatively high iron content, but in special instances may be due,
or partly due, to concentrations of magnetic minerals. By means of
the magnetic anomalies, various rock bodies or structural features,
such as faults or folds, may be traced into, or across, areas of few or no out-
crops. In many instances, however, no interpretation of particular anomalies
may be possible without further geological information.
