MAP 3828G The magnetic data on this map were compiled from information recorded along the flight lines shown. The anomalies expressed by the magnetic contours are dependent on the variable magnetic intensities of Airborne Magnetic Survey, February 1967 to June 1968 the underlying rocks, and may be due to conditions near, or at unknown DISTRICT OF KENORA by Lockwood Survey Corporation Ltd. depths below the surface. High magnetic anomalies normally indicate the presence of basic rocks, such as diabase, gabbro, or serpentinite, which ONTARIO The planimetry for this map was obtained from have a relatively high iron content, but in special instances may be due, topographical map sheets published by the or partly due, to concentrations of magnetic minerals. By means of Department of Energy, Mines and Resources, Ottawa. the magnetic anomalies, various rock bodies or structural features, such Scale: One Inch to One Mile = $\frac{1}{63,360}$ as faults or folds, may be traced into, or across, areas of few or no out-No correction has been made for regional variation. crops. In many instances, however, no interpretation of particular anomalies may be possible without further geological information.
