AEROMAGNETIC SERIES

SHEET 115 <sup>H</sup>/<sub>4</sub>

MAP 3292G

# McKINLEY CREEK

## YUKON TERRITORY

Scale: One Inch to One Mile =  $\frac{1}{63,360}$  Miles

Air photographs covering this map area may be obtained through the National Air Photographic Library, Topographical Survey, Ottawa, Ontario.

Copies of this map may be obtained from the Director, Geological Survey of Canada, Ottawa.

PUBLISHED 1966

ISOMAGNETIC LINES (total field):

- 500 gammas . . . . .
- 100 gammas . . . . .
- 20 gammas . . . . .
- 10 gammas . . . . .
- Magnetic depression . . . . .
- Flight lines . . . . .

Flight altitude: nominally 1000 feet above ground level where terrain permitted.

Airborne Magnetic Survey, June 1964 to February 1966, by Canadian Aero Service Limited, Ottawa.  
No correction has been made for regional variation

The planimetry for this map was obtained from topographical sheets published by the Army Survey Establishment R.C.E.

The magnetic data on this map were compiled from information recorded along the flight lines shown. The anomalies expressed by the magnetic contours are dependent on the variable magnetic intensities of the underlying rocks, and may be due to conditions near, or at unknown depths below the surface. High magnetic anomalies normally indicate the presence of basic rocks, such as diabase, gabbro, or serpentine, which have a relatively high iron content, but in special instances may be due, or partly due, to concentrations of magnetic ore minerals. By means of the magnetic anomalies, various rock bodies or structural features, such as faults or folds, may be traced into, or across, areas of few or no outcrops. In many instances, however, no interpretation of particular anomalies may be possible without further geological information.
