The ship magnetometer survey was conducted between May and June 1962, 1963 using a direct-reading proton free-precession magnetometer. The ship's position was controlled by a Two Range Decca Survey System. The survey and subsequent compilation were carried out by personnel from the Geophysics Division, Geological Survey of Canada, Drafting by Spartan Air Services Ltd.

The magnetic contours drawn in red and bathymetric contours shown in grey were compiled from data recorded along the ship's track which is indicated by cross-ticks on the bathymetric contour. The bathymetric contours given in feet are obtained from echo-sounding records and depth calculations have been made assuming a velocity of sound in sea-water of 4,900 feet per second. The echo-sounding equipment was installed on a CHS ship which also carried out the magnetometer survey.

No correction has been made for regional variation.
