

## GEOPHYSICAL SERIES (AIRBORNE GAMMA-RAY SPECTROMETRIC)

Published, 1977

This map was compiled from airborne gamma-ray spectrometer data recorded digitally along the flight lines shown. The spectrometer, with 50 litres of sodium iodide (NaI(Tl)) detectors, recorded gamma radiation in four channels, with the following energy ranges:

Channel 1 .....	2.42 – 2.82 MeV
-----------------	-----------------

Channel 1.....	2.42 – 2.62 MeV
Channel 2.....	1.66 – 1.86 MeV
Channel 3.....	1.36 – 1.56 MeV
Channel 4.....	0.40 – 2.82 MeV

Channels 1, 2 and 3 were centered on the 2.62 MeV  $\text{Ti}^{40}$  photo peak, the 1.76 MeV  $\text{Br}^{74}$  photo peak and on the 1.46 MeV  $\text{K}^{40}$  photo peak, respectively. Counts were accumulated in these channels and recorded at one second intervals. The terrain clearance was averaged and recorded at one second intervals. The detectors were thermally stabilized to minimize spectrum shift. The survey aircraft were flown at a planned survey altitude of 400 feet and at a ground speed between 190 km/hr and 240 km/hr.

ground radiation, spectral scattering and deviations of terrain clearance from the planned survey altitude. Corrected count rates from channels 1, 2 and 3 were converted to concentrations of equivalent thorium, equivalent uranium, and potassium, using conversion factors determined for each gamma-ray spectrometer used in the survey. The total count rates from channel 4 were converted to units of radioelement concentration. The conversion factors

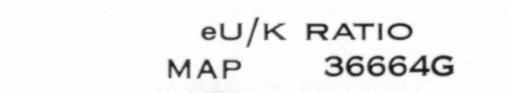

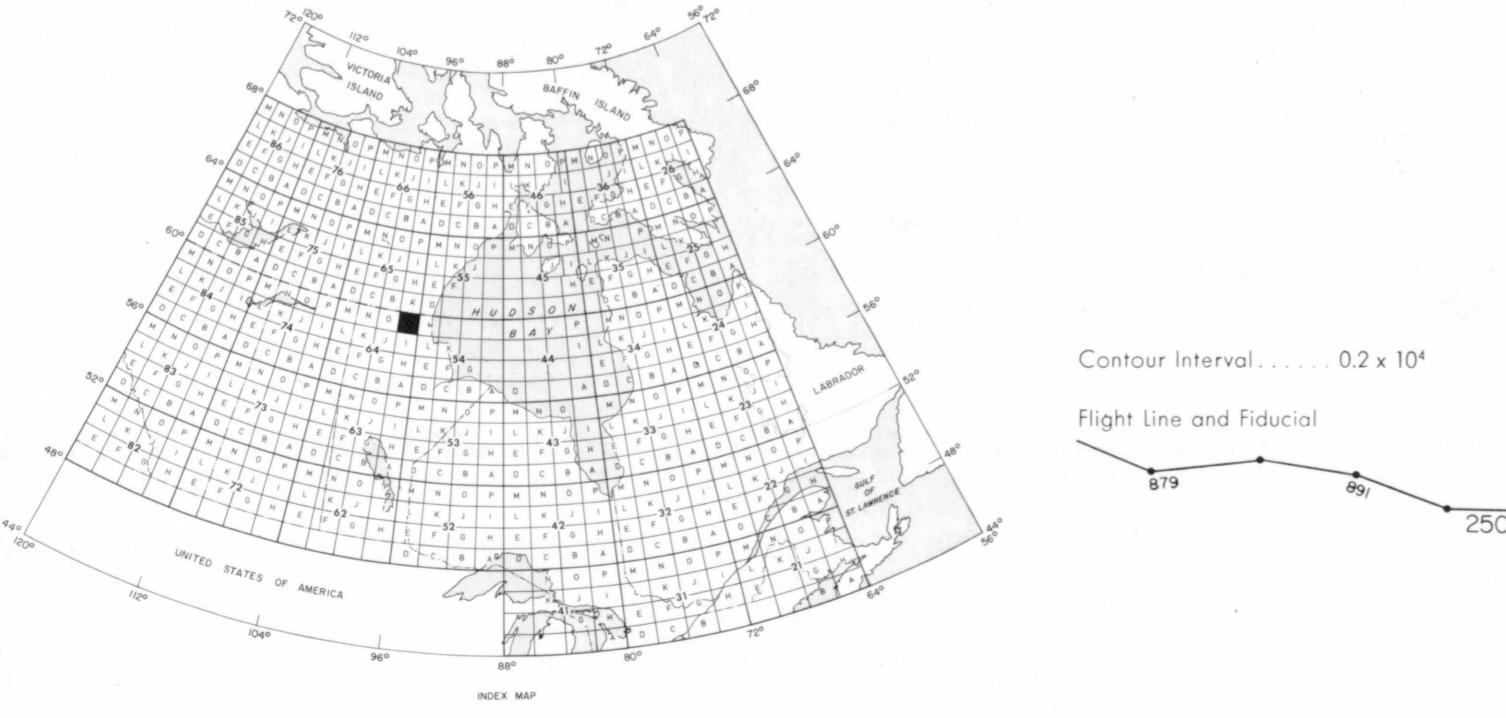

channel 4 were converted to units of radioelement concentration. The conversion factors which differed among the 3 aircraft used, are approximately those listed below:

Channel 1 .....	1 ppm eTh	$\approx$	6 cps
Channel 2 .....	1 ppm eU	$\approx$	8 to 10 cps
Channel 3 .....	1 %K	$\approx$	70 to 80 cps
Channel 4 .....	1 ur	$\approx$	140 to 160 cps

Data were smoothed using 40 data points along the flight lines (rejecting values over

The contoured values are surface radioelement concentrations averaged over areas of approximately 700,000 square meters. These areas generally include some outcrop, overburden, and small bodies of water. Consequently, the concentrations indicated

approximately 1000 km<sup>2</sup> of the area is generally covered by talus, scree, alluvium, boulders, swamps and small bodies of water. Consequently the concentrations indicated by the contour map are generally lower than the concentration in bedrock.
