Parts of 106 D, E and 116 A, H

Note: This legend is common to National Geochemical Reconnaissance Map 14-1976, Open File 419, Map 15-1976, Open File 419 and Map 16-1976, Open File 420

LEGEND

QUATERNARY
- [Q] Unconsolidated glacial and alluvial deposits

PROTEROZOIC
- **HELIKIAN**
  - [Pc] SAMPSON FORMATION, shale and conglomerate; CAL RIVER FORMATION, sandstone, shale and [Pcl] CARLSON MEMBER, basal conglomerate
  - [Pb] BASEMENT COMPLEX, undifferentiated metamorphic and granitic rocks
  - [Pm] MONZONITES and hornblende/biotite syenite, commonly porphyritic and coarse textured; minor diorite
- **DIORITE and gabbro**
- **PURCELL**
  - [Pp] Pethei green and maroon shale and brown siltstone
  - [Ph] HORN HILL QUARTZITE; massive quartzite, minor slate and phyllite
- **APHEBIAN**
  - [Pl] LIARD GROUP, divisions: argillites, slate, phyllite and minor quartzite; [Pl] Tu, tuffaceous unit (Hay)
- **TRANSITIONAL**
  - [Pk] SAMBLIN FORMATION; limestone and shale; unnamed clastics and carbonates

PHANEROZOIC
- **CRETACEOUS**
  - [K] CRANBERRY FORMATION; grey sand and limestone; [K] JERMAIN CREEK FORMATION, sandstone, siltstone, shale, carbonaceous and limestone; undivided
- **CARBONIFEROUS TO PERMIAN**
  - [CP] FANTASY FORMATION; shale and limestone; [MAY RIVER FORMATION; shale, siltstone, limestone and minor sandstone; [MAY] Ls, limestone member; [MAY] Sh, shale member; [MAY] undivided; [CP] Fantasy and May River formations, undivided
  - [C] COY LAKE FORMATION; shale; unnamed conglomerate
- **DEVONIAN**
  - [D] MIDDLE DEVONIAN TO CARBONIFEROUS
  - [D] KAKISA FORMATION; limestone; [D] BEAVER RIVER FORMATION; shale; [D] LOWER CONGLOMERATE AND CHERT-BEARING LIMESTONE MEMBER; shale, argillite, quartzite and minor chert-nodule conglomerate and limestone

LOWER TO MIDDLE DEVONIAN
- [D] ARNICA FORMATION; limestone; CAMSELL FORMATION, limestone, dolostone and minor shale; [D] UNDIVIDED; unnamed limestone, dolostone and intermediate to basic clastics

ORDOVICIAN AND SILURIAN
- [S] ROAD RIVER FORMATION; shale, limestone, black chert and argillite; [S] UNDIVIDED; unnamed shale, limestone and dolostone
- [S] Dolostone and limestone; argillaceous limestone and dolostone; dark calcareous shale

CAMBRIAN
- [C] Limestone and dolostone; minor red shale; unnamed clastics; Mt. Kindle Formation, Whittaker Formation, Cathedral Formation, Arctomys Formation, Mt. Cap Formation; [C] Mt. CAP] UNDIVIDED; limestone, dolostone and minor shale

PRECAMBRIAN AND/OR LATER
- [Y] Dark green volcanic rocks, breccia, tuff, agglomerate, shale, argillite, limestone and conglomerate
- [Y] Quartz porphyry, quartz-sericite conglomerate, gneiss and green stone; intrusive contact; quartz-mica schist; argillite, limestone and black chert

ARCHEAN
- [A] Unnamed carbonates and clastics
- [A] MARTIN GROUP; mafic volcanics, iron formation and dolomite

PALEOZOIC
- [PZ] UNDIVIDED FORMATIONS; sandstone and dolomite; [PZ] PEEL FORMATION; sandstone and dolomite; unnamed sedimentary rocks and gabbro
- [S] Orange dolomite, shale, argillite, grey dolomite, grey and maroon shale; [S] UNDIVIDED; limestone, dolomite, black shale, argillite and siltstone

MILLIGAN AND CO. ANALOGUE
- [S] Argillite, shale, argillite quartzite, dolomite, conglomerate and siltstone; undivided

Drift-covered areas.....
Geological contacts.....
Faults.....

Geology generalized for geochemical sheets by W.G. Gooderham from Rock Creek (1081) and Snake River (1080) by D.G. Cameron; Fort Norman (1079) and Grand River (1082) and Bear River (1180) by D.G. Harris (D.G.C. Open File 279, 1976)

Geological cartography by the Geological Survey of Canada

Base-map assembled by the Geological Survey of Canada from maps published at the same scale by the Surveys and Mapping Branch in 1954, 1973

Mean magnetic declination 1971, 34°52.7' East, decreasing 7.3' annually. Readings vary from 34°05.3' in the SE corner to 34°56.9' in the NW corner of the map-area

Elevations in feet above mean sea-level

GEOCHEMICAL SYMBOLS AND DATA PRESENTATION

The absolute background and anomalous concentrations, and the contrast between them will vary regionally depending on factors such as the physiography, geology, the nature of the drift cover and the type of sample collected.

Physiographical regions within the survey area include the Mackenzie, Ogilvie and Richardson Mountains, and the Eagle Plains and Bonnet Plume basin. Most of the soil-forming parent materials in the mountainous areas are derived from the mechanical breakdown of the underlying rocks and has been transported as gravitational debris and by heavy spring run-off. Stream sediments range in size from fine silt to boulders with little chemical weathering evident. By contrast, erosion processes in the Eagle Plains and Bonnet Plume basin are slower, the soil-forming materials are mainly tills and deposits of organic-rich sediment. Under these conditions, organic matter may become important in playing a significant role in the transport and deposition of certain elements (eg. U, Zn, Cu, Co, Ni, Mo, etc.) and may therefore produce spurious anomalies. It is important that the type of sample collected and the physiographical factors be taken into consideration when examining the metal content of any specific site.

The geology of the survey area is represented by sedimentary, volcanic and intrusive rocks ranging in age from Archean to Recent. Rocks of Proterozoic and Paleozoic age almost evenly partred represented. To date, ore bodies reported to occur in basins associated with the Proterozoic sedimentary and volcanic rocks of the Wernecke Mountains, Ogilvie Mountains and Richardson Mountains. Mineral deposits also occur in carbonate rocks in the survey area include the Paleozoic; the Redstone platform (shale and dolomites), the Paleozoic shales as a source of low grade and high tonnage Sn, the Proterozoic Hart River Group as a source of Pb, Zn, Ag, Cu, Ba, Au, Sb, Hg, Mo, Co, Ni, Cr, Ti, Be, Sn, Ga, Sr, Zr, Y, La, Nb, Pb, Th, U, Ce, Nd, Sc, V, Mn, Fe, Ca, P, Mg, Na, K, Al, Li, Rb, Cs, Tl, Ba, Ta, W, Re, Au, Hg, Sb, Se, Te, Bi, Ge, Sn, Ga, In, Ag, Cd, Pd, Pt, Rh, Ru, Ir, Os
