1. TOPOGRAPHY
Slope inclination: degrees description
0-1 level gentle
1-15 moderate
15-35 steep
>35 cliffed

2. VEGETATION
See 'plant communities' legend sheet.

3. SENSITIVITY AND TRAFFICABILITY, TESTED RATINGS
Three periods of the year are recognized in the ratings.
Winter: Temperature of surficial materials is below freezing-point. Snow may be blown clear of large areas.
Summer: Period of snow ablation by melting, with air temperatures consistently above freezing-point. Generally between late June and mid-July for this region, but variable areally and by altitude, and may only extend over 1-2 weeks at any one location. Can extend through the summer beyond perennial snowbanks. The active layer is shallow, with a high moisture content, often super-saturated. Even gravels may be near a fluid state, and most mass movement takes place in this period.

From the onset of the snowmelt to the onset of the winter freeze-up in late August. Generally a period of erosion from the active layer, especially from the upper 5 m in unconsolidated areas, and desiccation of fine grained materials. Precipitation mainly rain; usually light or of short duration, on rare occasions heavy (ca. 5 mm in a 24-hour period).

SENSITIVITY
This is considered to be the susceptibility of an area to disturbance, where disturbance is a man-initiated change in surface characteristics. Disturbance may be caused by direct action of man, or occur subsequent to such action as a result of a change in the equilibrium of natural processes. In the latter case, most physical changes of the surface take place during the summer, even if the initiating activity occurred in winter. Original surface conditions may be naturally restored though it is more likely that changes will be permanent.

TRAFFICABILITY
This is the probability of disturbance occurring, and the degree to which it occurs.
LOW: possibly medium, locally high during snowmelt or prolonged rainfall. No disturbance or minor at other times.

MEDIUM: probably high during snowmelt or prolonged rainfall. Disturbance of part or all of the area of activity, but processes not expected to extend disturbance beyond this area.
HIGH: disturbance of all or substantial part of area of activity, and processes likely to expand disturbance beyond this area. Expected to hinder continued activities.

FORM - the probable form of disturbance
A. Disruption of surface drainage, especially by:
(i) Concentration, leading to erosion (e.g. culverting only a small percentage of the rills or gullies which cross a road route).
(ii) Ponding, leading to (a) overflow and erosion;
b) thermal erosion under and adjacent to standing water;
B. Thermal erosion: Initiation or acceleration of ground ice thaw, especially critical over ice wedges. Caused by stripping vegetation, excavation, ponding water.

C. Slope failure: instability potential after excavating or loading. Includes areas where mass movement processes very active. Lower case letters indicate only part of the unit affected: e.g. slope failure on stream banks, thermal erosion of ice wedges which cover only part of the unit.

TRAFFICABILITY
Assessment of terrain in terms of performance of Arctic tracked vehicles.
Roughness or grade
1. Easily traversable in all directions.
2. Traversable, but with difficulty locally or in some directions.
3. Difficult or impossible.
Traction - includes assessment of ability of surface to bear the vehicle. First value for snowmelt and heavy rain periods / Second value for summer. Traction is not normally a problem in winter.
1. Easily traversable.
2. Traversable, with slight or local difficulty.
3. Difficult.
