

FWAT

The regional geochemical trend map displayed above utilized a moving weighted average using an inverse distance function ($1/d^2$) to filter out minor irregularities and emphasize broad-scale regional features. Single point anomalies may be suppressed or eliminated, however, geological units which are chemically enriched, or large metallic deposits undergoing weathering would be expected to produce identifiable anomalies.

CONTRACTORS

Sample collection by McElhanney Surveying and Engineering Ltd., Vancouver

Sample preparation by Golder Associates, Ottawa (1984) and
Kamloops Research and Assay Laboratory Ltd., Kamloops B.C. (1985)

Sediment chemical analyses by Barringer Magenta Ltd., Rexdale, Ontario (1984) and
Bondar-Clegg and Company Ltd., North Vancouver, B.C. (1985)

Water chemical analyses by Barringer Magenta Laboratories (Alberta) Ltd., Calgary (1984) and
Chemex Labs Ltd., North Vancouver, B.C. (1985)

Copies of map material and listings of field observations and analytical data, from which the material was prepared, may be available at users expense by application to:

K.G. Campbell Corporation

Contribution to Canada-British Columbia Mineral Development Agreement 1985-89, a subsidiary agreement under the Economic and Regional Development Agreement. West half of the project jointly funded under a letter of understanding by the Geological Survey of Canada and British Columbia. East half of the project funded by British Columbia

Energy, Mines and Resources Canada
Energie, Mines et Ressources Canada

Canada

- Undivided Glaciofluvial, Glaciolacustrine and moraine deposits: sand, silt, gravel and clay with local accumulations up to 70 m thick along valley bottoms: may include meltwater or outwash channel deposits, alluvium, varved silt, clay and sand, glacial till and ground moraine
- Predominantly Rock: below 1,700 m elevation, discontinuous veneers of glacial till and ground moraine, and minor colluvium; valley bottoms may contain drumlinoid features, fluting, kame and esker complexes
- Glaciers, permanent snowfields
- Ice flow direction inferred from various data
- Fluting, glacial striae

GEOLOGY AND MINERAL DEPOSITS

Generalized geology after Geological Survey of Canada, Map 1356A to accompany Paper 72-35, *Geology of McBride Map Area, British Columbia*, by R. B. Campbell, E. W. Mountjoy, and F. C. Young Geological Survey of Canada Map 1424A, *Persim River, British Columbia*, 1:1 000 000, compilation by H. W. Tipper, R. B. Campbell, G. C. Taylor, and D. F. Scott, 1979; Figure 2, Geological Map of the Cariboo River Area, accompanying British Columbia Ministry of Energy, Mines and Petroleum Resources Bulletin 47, *Geology of the Cariboo River Area*, by A. Sutherland Brown, 1983; and Geological Survey of Canada Open File 781, *Bedrock Geology of Barkerville-Cariboo Area*, by L. C. Struck, 1981, used to determine dominant catchment basin rock type for grouping of geochemical data.

* The four-letter mnemonic name indicates rock type and the two-digit number indicates age.

For location of the following specific information for this area refer to British Columbia Ministry of Energy, Mines and Petroleum Resources: Mineral Deposits, refer to Mineral Inventory Map (MIM) 93H (McBRIDE); Assessment Reports, refer to Assessment Report Index Map (AR) 93H (McBRIDE); Bedrock Geological Mapping Reports, refer to *Index to Bedrock Geological Mapping, 1983*; Mineral and Placer Claim Maps, contact Ministry of Energy, Mines and Petroleum Resources, Titles Branch, for current editions.

This map forms one of a series of maps released by the Geological Survey of Canada, Open Files 1214 to 1216. This Open File consists of maps of various geochemical variables: 18 for stream sediment, 3 for stream water and 1 sample site location
