ABSTRACT

As part of the Great Lakes International Multidisciplinary Program on Crustal Evolution (GLIMPCE), approximately 1350 km of deep reflection data were recorded along eight lines in Lakes Superior, Michigan and Huron. The survey was designed to resolve the deep structure of the Midcontinent Rift and the Hemlo and Michipicoten Granite/Greenstone Belts in Lake Superior, the Grenville Front and Huronian continental margin in Lake Huron and the Penokean Orogen and Niagara Fault in Lake Michigan. Data were generated using an approx. 128 litre airgun array, recorded with a 120 channel streamer, conventionally processed in CMP geometry, and migrated. The migrated data presented in this report are plotted at 1:200000. This format allows interested parties to interpret the data independently and to compare directly the results with a wide variety of seismic reflection data being released by other groups.

RÉSUMÉ

Dans le cadre du programme GLIMPCE (Great Lakes International Multidisciplinary Program on Crustal Evolution), environ 1350 km de sismique réflexion profonde furent recueillis le long de huit profils dans les lacs Supérieur, Michigan et Huron. Le levé était destiné à résoudre les structures profondes du rift Keweenawien et des ceintures de roches vertes d'Hemlo et de Michipicoten dans le lac Supérieur, le Front du Grenville et la marge continentale huronienne dans le lac Huron et l'orogénie Pénokéenne et la faille Niagara dans le lac Michigan. Les données furent enregistrées en utilisant un réseau de canons à air d'environ 128 litres comme source et une flûte à 120 canaux comme système d'écoute. Les données furent ensuite traitées conventionnellement selon la géométrie CMP et furent finallement migrées. Les données présentées dans ce rapport sont à l'échelle 1:200000. Ce format permet aux personnes intéressées d'effectuer leur propre interprétation ou encore d'effectuer une comparaison directe avec les autres données de sismique réflexion disponibles.

INTRODUCTION

The Geological Survey of Canada, through its contribution to LITHOPROBE, and the U.S. Geological Survey funded jointly the first experiment of the Great Lakes International Multidisciplinary Program on Crustal Evolution (GLIMPCE). GLIMPCE aims to resolve the structure and evolution of the crust beneath the Great Lakes region. In August and September 1986, approximately 1350 km of deep reflection data were collected along eight profiles using an approx. 128 litre tuned airgun array and a 120-channel data acquisition system. A generalized geological map of the Great Lakes region with the location of the seismic profiles is shown in Figure 1. Seismic reflection profiles A,B,C,F and G are located in Lake Superior, profile H is located in Lake Michigan, and profiles I and J are located in Lake Huron. The survey was designed to resolve the deep crustal structure of the Keweenawan Rift (profiles C,A,G,F and H), the Hemlo and Michipicoten Granite/Greenstone Belts (B), the Grenville Front (J), the Huronian continental margin (I) and the Penokean Orogen and Niagara Fault (H) [3].

Migrated reflection profiles are displayed in this report, and necessary information on data acquisition, processing and display parameters is documented. Details of the conventional CMP processing sequence that led to the stacked seismic sections are given in Lee and others [6]. A summary of the simultaneous acquisition of wide-angle reflection/refraction data by government and academic groups is given in Hutchinson and others [5]. No interpretations of GLIMPCE data are given here. Preliminary results have been reported by Behrendt and others [1], Green and others [4] and Cannon and others [2].

EXPÉRIENCE GLIMPCE EXPERIMENT 1986

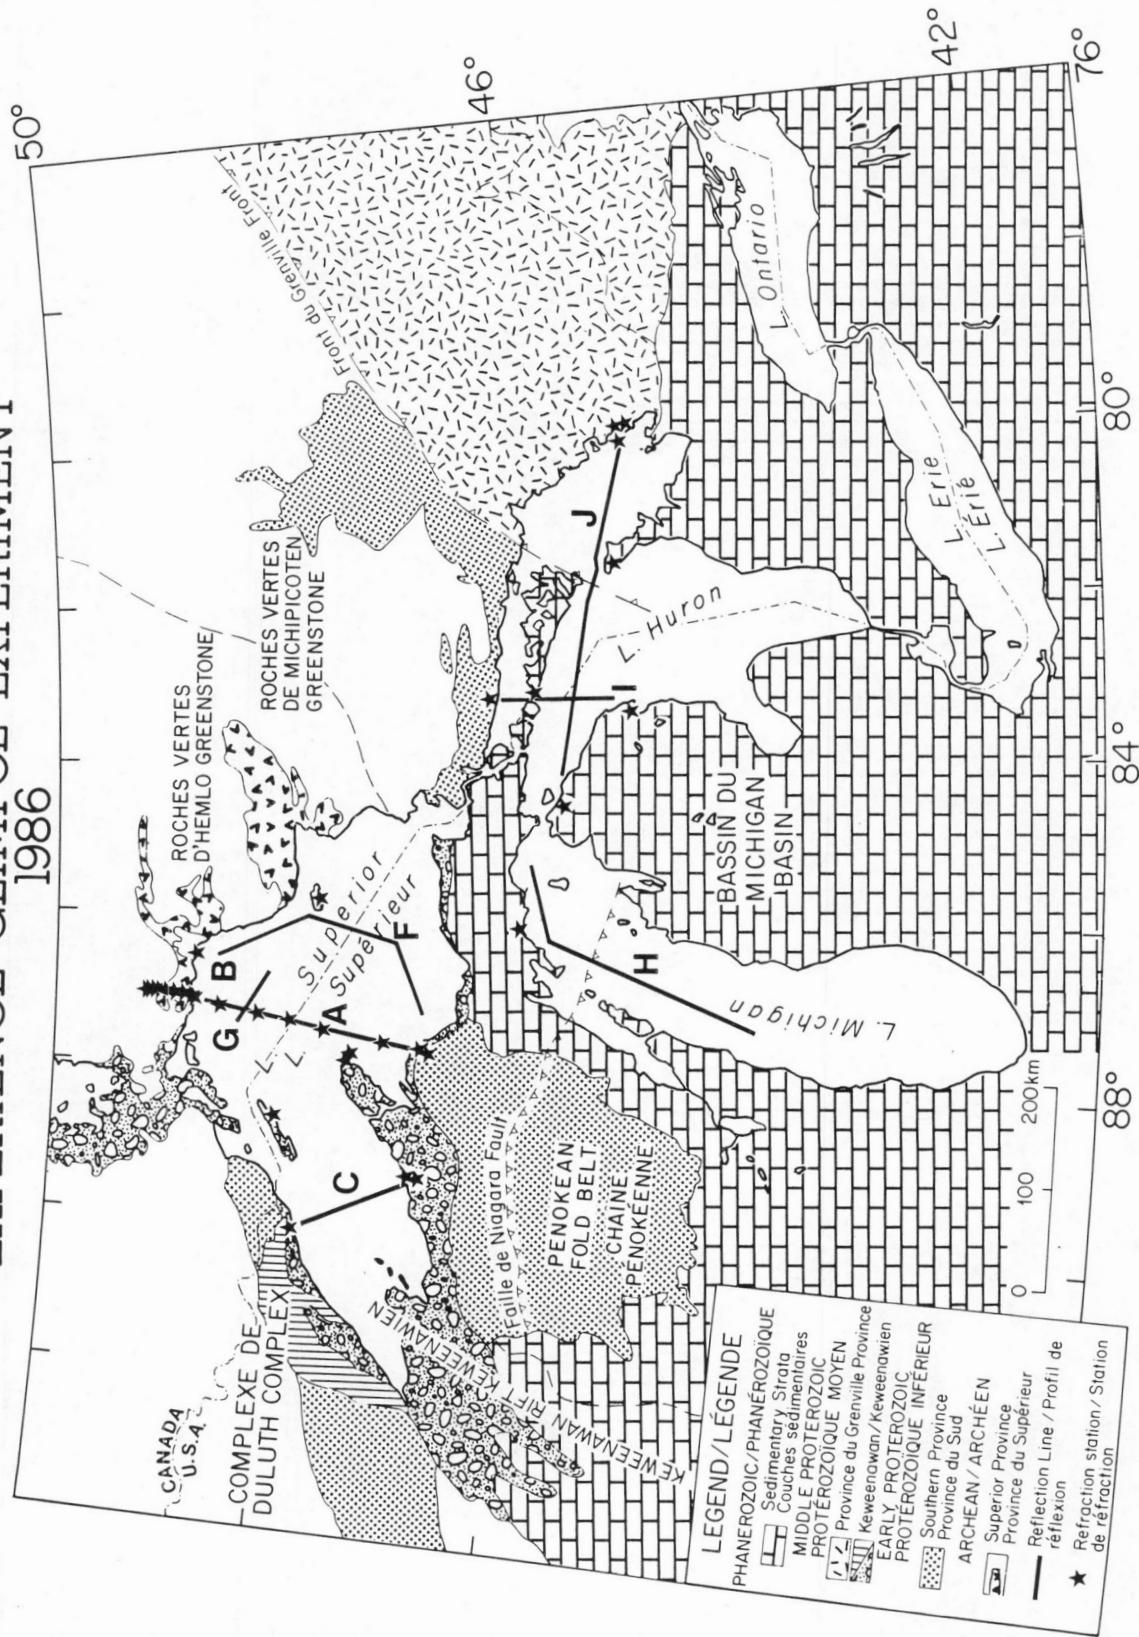

FIGURE 1

DATA ACQUISITION

The marine seismic survey for the Geological Survey of Canada and the U.S. Geological Survey was conducted by Geophoto Services, Ltd. (Calgary). The M/V Fred J. Agnich (Geophoto Party 2995) generated the energy for one line of seismic refraction data and collected 1345.35 km of reflection data during the period of 29/08/1986 to 23/09/1986.

Basic Field Parameters

Vessel	M/V Fred J. Agnich
Source	wide tuned airgun array 127.48 L total volume 60 active guns 80 m array width 6-12 m operating depth 74 m distance: antenna - array 228-236 m distance: array - near group source interval: 50 m or 62.5 m coverage: 3000 or 2400 %
Streamer	3024 m length 120 groups 25 m group length 27 hydrophones/group 10 - 14 m average towing depth

Recording Instrument	Texs Instruments DFS V
	120 seismic channels
	4 ms sample period
	64.0 Hz High-cut
	5.3 Hz Low-cut
	20 s record length
Navigation	GEONAV, Loran-C

A detailed summary of shotpoint locations, water depths and dates for all eight reflection profiles is given in Table 2. The information given there should be sufficient to permit reprocesssing of the original data, or to merge GLIMPCE seismic profiles with existing geophysical data bases.

CMP DATA PROCESSING

Phase 1 processing of GLIMPCE reflection data was undertaken at the USGS seismic processing center in Denver, Colorado; a detailed description of the original CMP processing sequence is given in Lee and others [6]. Phase 2 processing, migration of the stacked profiles, was completed at the Lithosphere and Canadian Shield Division's seismic processing center in Ottawa.

A brief example of the basic CMP processing sequence leading to stacked seismic sections is listed below.

Processing Sequence

1. Demultiplex
2. Recording gain removal
3. Geometry definition
4. Trace editing
5. Resample to 8 ms
6. F-K filtering in shot domain

4 - 45 Hz, +/- 5 ms/trace

width: 13 traces, length: 31 points

7. CDP sort (24 or 30 fold)
- 8,18 Automatic gain control length: 1000 ms
- 9,11 Velocity analysis
10. Preliminary stack

12. Multiple suppression in CDP domain
correlation velocity: 1700 m/s
application gate: 0- 3000 ms
13. Normal moveout correction
14. First break noise suppression (mute)
15. Pre-stack deconvolution
type: spiking, operator: 59 points
3 windows: 0-4 s, 3-12 s, 10-20 s
16. Stack 24 or 30 fold
17. Bandpass filter
time: 0-2 s, filter: 4/8 - 30/36 Hz
time: 5-8 s, filter: 4/8 - 28/31 Hz
time: 12-20 s, filter: 4/8 - 25/30 Hz
linear interpolation between application windows
19. Post-stack predictive deconvolution
type: 2nd zero crossing, length: 53 points
windows: 0-5 s, 6-20 s
20. Vertical sum (4 to 1)
50 m CMP spacing
21. Automatic gain control length: 2500 ms
22. Post-stack amplitude smoothing
2-d smoother: 3 traces x 3 samples
23. Display/Output to tape
SEG-Y data format

MIGRATION

Migration is an essential step before seismic data can be used for mapping reliably deep crustal structure. Dipping and curved reflections do not appear at their correct positions in CMP processed sections and diffraction patterns can make interpretation difficult; dipping and curved events are always defocused so that their apparent lengths are frequently overestimated and their apparent dips underestimated [8]. Migration is the process applied to seismic profiles by which these effects are corrected. Hence, structural interpretations of complex deep seismic reflection records should always be based on migrated data.

A frequency-wavenumber (F-K) migration scheme [11] was chosen to migrate the approximately 1350 km of deep crustal GLIMPCE reflection data. The F-K migration algorithm has proven to be exceptionally fast, providing stable results for all dips of interest in the presence of low to moderate noise levels [8]. F-K migration is correct only for constant velocity migration but in practice, smooth time dependent velocity variations and lateral velocity variations can be handled by the algorithm without distorting the seismic image significantly. The uniformly high average crustal velocities (i.e. 6.0 - 6.5 km/s) recorded by GLIMPCE data justify the application of F-K migration.

The following criteria have been used to determine the optimum migration velocities for each of the GLIMPCE reflection profiles: (a) focusing of diffraction patterns, (b) unraveling complex structure, and (c) minimizing migration noise (e.g., smiles). The final migrated sections have been stored in SEG-Y format. Pre-migration processing parameters

(where applicable) and migration velocities used are summarized in Table 1.

Migration Processing Sequence

1. Input stacked section from SEG-Y format tape
see data processing: step 23.
2. Bandpass filter
optional, pre-migration
7/9 - 35/40 Hz
or 14/17 - 35/40 Hz
3. Velocity filter
optional, pre-migration
taper: +/- (3.0 - 3.9) km/s
4. Constant velocity F-K migration tests
velocity interval: 4000 - 8500 m/s
velocity increment: \leq 250 m/s
5. F-K migration
chosen velocity distribution
6. Display/Output to tape
SEG-Y data format

COHERENCY FILTER AND DISPLAY

“A current stumbling block to the use of deep seismic reflection data by the earth science community is the lack of easy access to conveniently-sized, inexpensive copies of seismic profiles displayed at a standard scale” [10]. For the release of GLIMPCE data we have adopted the COCORP Atlas format, with the following modifications: (a) we present migrated profiles (for reasons outlined above), and (b) we use a different filter for coherency enhancement.

Coherency Enhancement

A semblance-based filter in the time domain has been designed to enhance coherent seismic energy and suppress incoherent background noise. Let the dip passband be defined for slownesses p_j , sampled at J equally spaced steps between p_{min} and p_{max} :

$$p_{min} \leq p_j \leq p_{max}, \quad j \in (1, \dots, J) ,$$

which should cover all apparent dips of the seismic data $u(x,t)$. For a given slowness (dip) p_j , the local multichannel coherency estimate $W(t, p_j; x_c)$ of the wavefield $u(x,t)$ at x_c is defined as [7-9]:

$$W(t, p_j; x_c) = \frac{w(t, p_j; x_c)^2}{L \sum_{l=1}^L u(x_l, t_l)^2}$$

where $w(t, p_j; x_c)$ is the local slant stack of a finite L-trace aperture centered at x_c ,

$$w(t, p_j; x_c) = \sum_{l=1}^L u(x_l, t_l) ,$$

and where $u(x_l, t_l)$ is the seismic data at distance x_l and at time t_l :

$$t_l = t + p_j(x_l - x_c) .$$

For the processing of GLIMPCE data we used a 9-trace aperture ($L=9$) to compute W for each point of the migrated wavefield. The coherency estimate W has values between 0 and 1; the lower bound describing complete incoherency and the upper bound indicating identical amplitudes $u(x, t)$ on all L traces across the aperture, associated with a coherent wavefront of slowness (dip) p_j . The coherency filter $C(x, t)$ for each point of the wavefield is defined as:

$$C(x, t) = \max(W(t, p_j; x))_j, \quad j \in (1, \dots, J) .$$

The coherency enhanced data $U(x, t)$ are given by

$$U(x, t) = u(x, t)C(x, t)^y + d ,$$

where y and d are scaling factors for display only.* It is worth emphasizing that the enhanced data $U(x, t)$ are weighted versions of the input data $u(x, t)$ and no data mixing or **smearing** is involved.

* For GLIMPCE data $y=1.5$ and $d=900$ have been used; the choice of y depends on the signal-to-noise ratio of the original data and the anticipated degree of enhancement of coherent seismic energy. Typical values for y are: $0.5 \leq y \leq 2.0$. The scaling factor d applies a dc-shift to the seismic data and improves the readability of variable area displays; the value of d is plotting software dependent.

Display Sequence

1. Input migrated section from SEG-Y format tape
see migration processing: step 6.
2. Vertical sum (2 to 1)
100 m trace spacing
3. Compute coherency filter
dip passband: +/- 3.0 km/s
4. Apply coherency filter
5. Display 16 s coherency enhanced data
vertical scale: 0.6 in/s
horizontal scale: 50 traces/in

Coherency enhanced migrated GLIMPCE reflection profiles are shown in the Appendix. Assuming an average crustal velocity of 6 km/s, these seismic profiles show no vertical exaggeration and the horizontal scale is approx. 1:200000. General survey information, profile direction, line intersections and shot point locations (see Table 2) are annotated.

SUMMARY

Results of phase 2 processing of the 1986 GLIMPCE seismic reflection data have been presented in this report. The approximately 1350 km of migrated data have been displayed in a format that allows interested parties:

- (a) to interpret the data independently,
- (b) to compare results with reflection data being released elsewhere,
- (c) to utilize compiled information for reprocessing the data, and
- (d) to merge results obtained from GLIMPCE data with other geophysical and geological data bases.

TABLE 1
MIGRATION VELOCITIES

In this section we document pre-migration processing steps (where applicable) and migration velocities as applied to GLIMPCE sections shown in the Appendix. Migration velocities used represent the "best smooth velocity model" for each of the profiles. * Velocity functions for the F-K migration (see listing below) have been linearly interpolated and smoothed.

Lake Superior

Profile A	length: 211.0 km
	time: 0, 20 s
	velocity: 5750, 6250 m/s
Profile B	length: 99.1 km
	time: 0, 20 s
	velocity: 5750, 6250 m/s
Profile C	length: 112.7 km
	time: 0, 3.5, 6.0, 9.0, 20 s
	velocity: 4500, 5000, 5750, 6000, 6250 m/s

* Migration of local targets may require the use of slightly different velocity models.

Profile F length: 161.5 km

time: 0, 3.5, 6.0, 8.0, 20 s

velocity: 4500, 5000, 5500, 5750, 6250 m/s

Profile G length: 55.7 km

time: 0, 20 s

velocity: 5750, 6500 m/s

LakeMichigan

Profile H length: 284.9 km

time: 0, 20 s

velocity: 5750, 6250 m/s

LakeHuron

Profile I length: 109.1 km

pre-migration processing 1 s agc

bandpass 7/9 - 35/40 Hz

velocity filter (taper): +/- (3.0-3.9 km/s)

migration time: 0, 20 s

velocity: 5750, 6250 m/s

Profile J length: 306.0 km

pre-migration processing: 1 s agc

bandpass 7/9 - 35/40 Hz

velocity filter (taper): +/- (3.0-3.9 km/s)

migration time: 0, 20 s

velocity: 5750, 6250 m/s

TABLE 2
SURVEY INFORMATION DATA SUMMARY
1986 GLIMPCE Reflection Survey

In this section we document survey dates, shotpoint locations (in UTM coordinates and latitudes and longitudes), and associated water depths (m) for each of the eight GLIMPCE profiles. Survey data for start position, end position and every 50-th shotpoint (approximately 2500 or 3125 m) have been listed. A complete list of information for all shot points has been archived at the GSC and USGS.

APPENDIX

MIGRATED CRUSTAL SECTIONS

Number of Plates : 10

GLIMPCE profiles H (Lake Michigan) and J (Lake Huron)* have been plotted on two separate plates (Part 1 and Part 2). Each of the remaining profiles (A,B,C,F,G and I) has been plotted on a single plate. The start and end locations of each profile are listed. Further control points have been specified for bending profiles (i.e. F,H).

* Note: the westernmost 5 km of Profile J data are not displayed
