

Figure 1 (in pocket). Resource potential ratings of the Wager Bay - Southampton Island region (explained in Tables I and II). Data used for these ratings are summarized on Fig. 2. Note that the area west of 92° was not included in field studies for this assessment (see Summary). The patterned area west of 92° is underlain by less deformed rocks of the Prince Albert Group (Fig. 3), therefore has higher mineral potential (MH) than the same domain east of 92° (M). The MH rating incorporates uncertainty due to lack of data, and is derived by extrapolation of geochemical data from east of 92° to previous geological maps by Schau (1982) and its enclosing gneisses.
