INTRODUCTION

Purpose

As part of the Canada-Nova Scotia Cooperation Agreement on Mineral Development, reconnaissance and detailed till sampling were completed in the Mira (NTS 11F/16) and Framboise (11F/9) areas of southeastern Cape Breton Island, Nova Scotia (Figure 1) during the 1990 and 1991 field seasons. The purposes of this project were to document changes in till provenance and relate these to the complex sequence of ice flow patterns known from glacial striae and to demonstrate methods for evaluating the mineral potential of the area using drift prospecting techniques. These were accomplished by examining the till stratigraphy exposed in coastal sections, by collecting regional till samples from across the entire study area, and by collecting closely spaced till samples around the Deep Cove and Blue Mountain mineralized bedrock occurrences and the Mindamar Mine at Stirling.

This open file report includes sample location information and descriptions, till geochemical data, till pebble lithology data, and limited bedrock and float boulder geochemical data. These data are listed in the appendices. Digital data files, including sample site UTM coordinates, site descriptions, till geochemical data, pebble lithology data and bedrock geochemical data, are available on computer diskettes. A 1:50,000 colour version of the bedrock geology map (Figure 4) is also available in digital form on 2 diskettes. Documentation on each diskette describes file contents and formats.

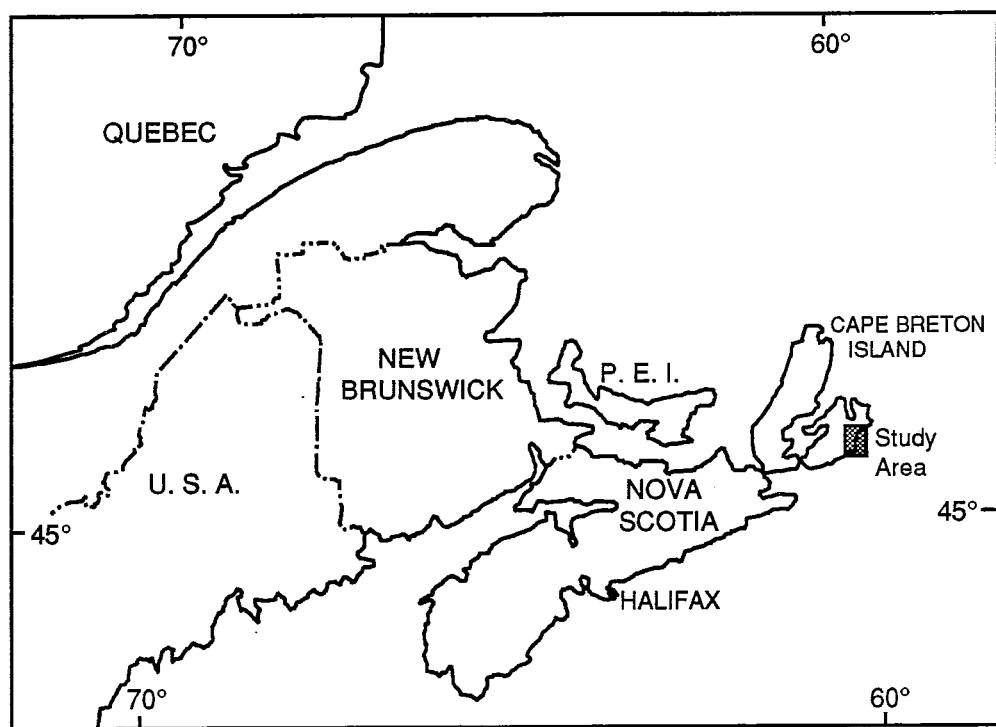

Figure 1. Location of the study area in eastern Canada.

A final report containing detailed interpretations of the data presented here and their relationship to the Quaternary stratigraphy of the area will be published at a later date. The results from the till geochemistry program provide baseline geological data for future mineral exploration and outline anomalous areas which warrant further investigation.

Location and Access

The Mira-Framboise area (Figure 2) is located on the southeastern side of Cape Breton Island, 15 km south of Sydney, between latitudes 45°38'N and 46°00'N and longitudes 60°00'W and 60°30'W. A detailed map of the study area, at a scale of 1:50,000, is included in the back pocket (Figure 3). The area includes parts of Cape Breton and Richmond counties and comprises approximately 1100 km². The area is bounded to the east by the Atlantic Ocean and to the northwest by East Bay of Bras d'Or Lake. The Mira River bisects the northern half of the area and flows north-northeastward through Marion Bridge towards its outlet at the Atlantic Ocean. Louisbourg National Historic Park is located on the northeastern shore of Gabarus Bay. Major villages in the study area include Marion Bridge, Gabarus, Fourchu and Framboise.

The Mira-Framboise area is traversed by Highways 327 and 4, running south-southwestward through the area from Sydney. Numerous secondary roads and logging roads provide access to most of the area. Those areas not accessible by vehicle were reached using a helicopter.

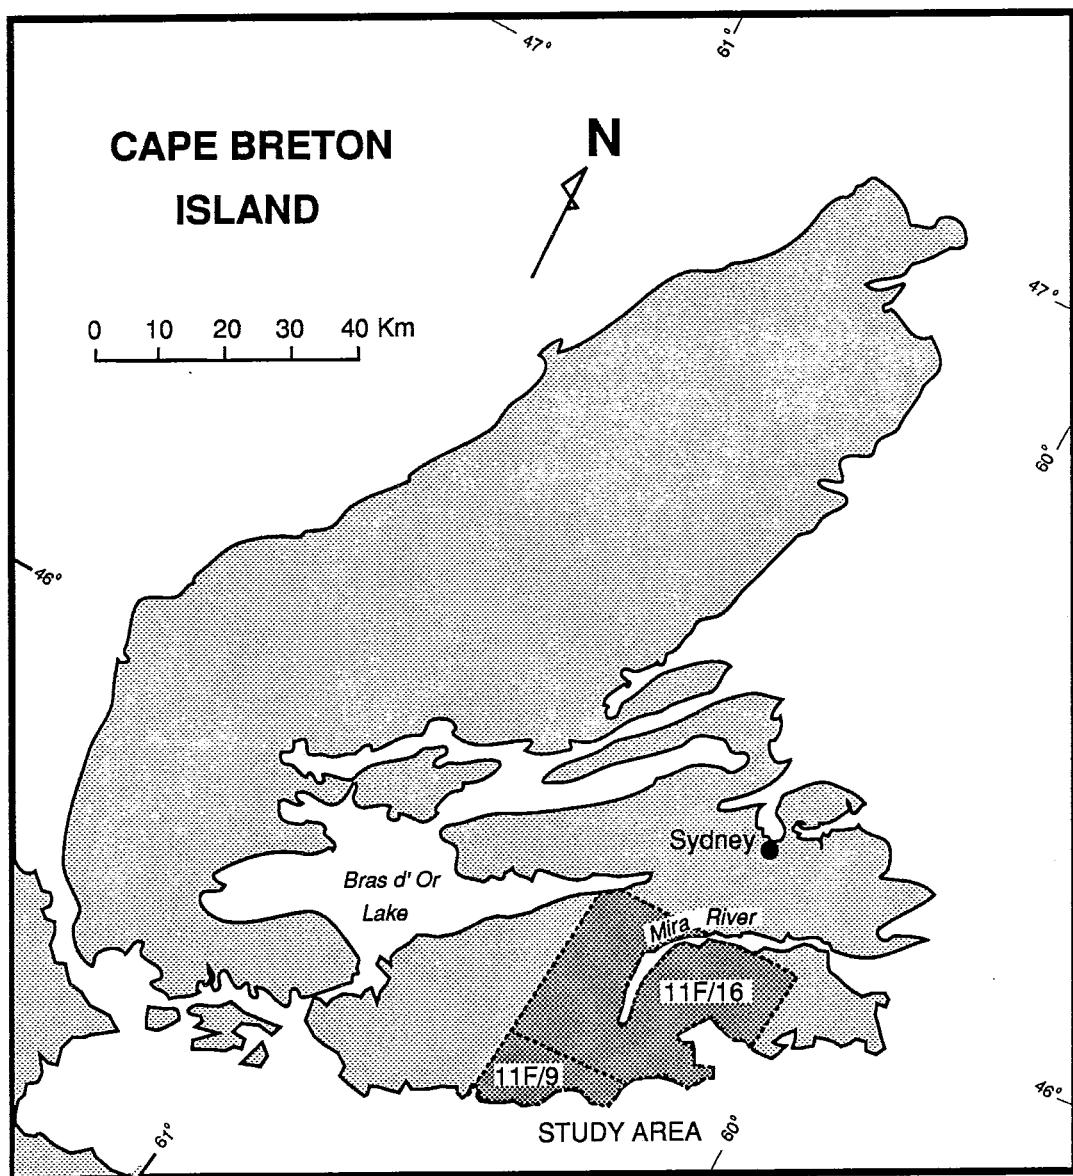

Figure 2. Location of study area in southeastern Cape Breton Island.

Previous Work

Fortescue and Hornbrook (1969) completed a biogeochemical survey around the Yava Pb deposit to determine the applicability of biogeochemical prospecting in southeastern Cape Breton Island. The Mira-Framboise area was included in two regional geochemical surveys that were completed by the Nova Scotia Department of Mines and Energy.. Stream sediments were collected as part of a regional survey completed in 1982 (Rogers, 1983) and lake bottom gyttja samples were collected as part of regional survey of eastern Cape Breton Lowlands (Rogers and MacDonald, 1984). Data from both surveys were combined and plotted as a series of Open File Maps (Rogers and MacDonald, 1986; Lombard, 1991). Sangster (1988) described the geochemical results and glacial dispersal patterns in B horizon soil samples collected in the Blue Mountain area, southeast of Marion Bridge. MacDonald et al. (1991) completed a detailed, multimedia (vegetation, humus, A horizon soil and till) geochemical study in the area surrounding the east zone of the Yava Pb deposit.

Geology

Bedrock Geology

Barr et al. (1990) have assigned all the rocks of the study area to the " Mira Terrane". According to Barr et al. (1990), the Mira Terrane consists of Precambrian Fourchu Group (Weeks, 1954) metavolcanic and metasedimentary rocks lying in northeast-southwest oriented belts, separated by younger, mainly sedimentary units (Figure 4). These units comprise late Precambrian to early Carboniferous clastic and volcanic rocks, several Cambrian clastic

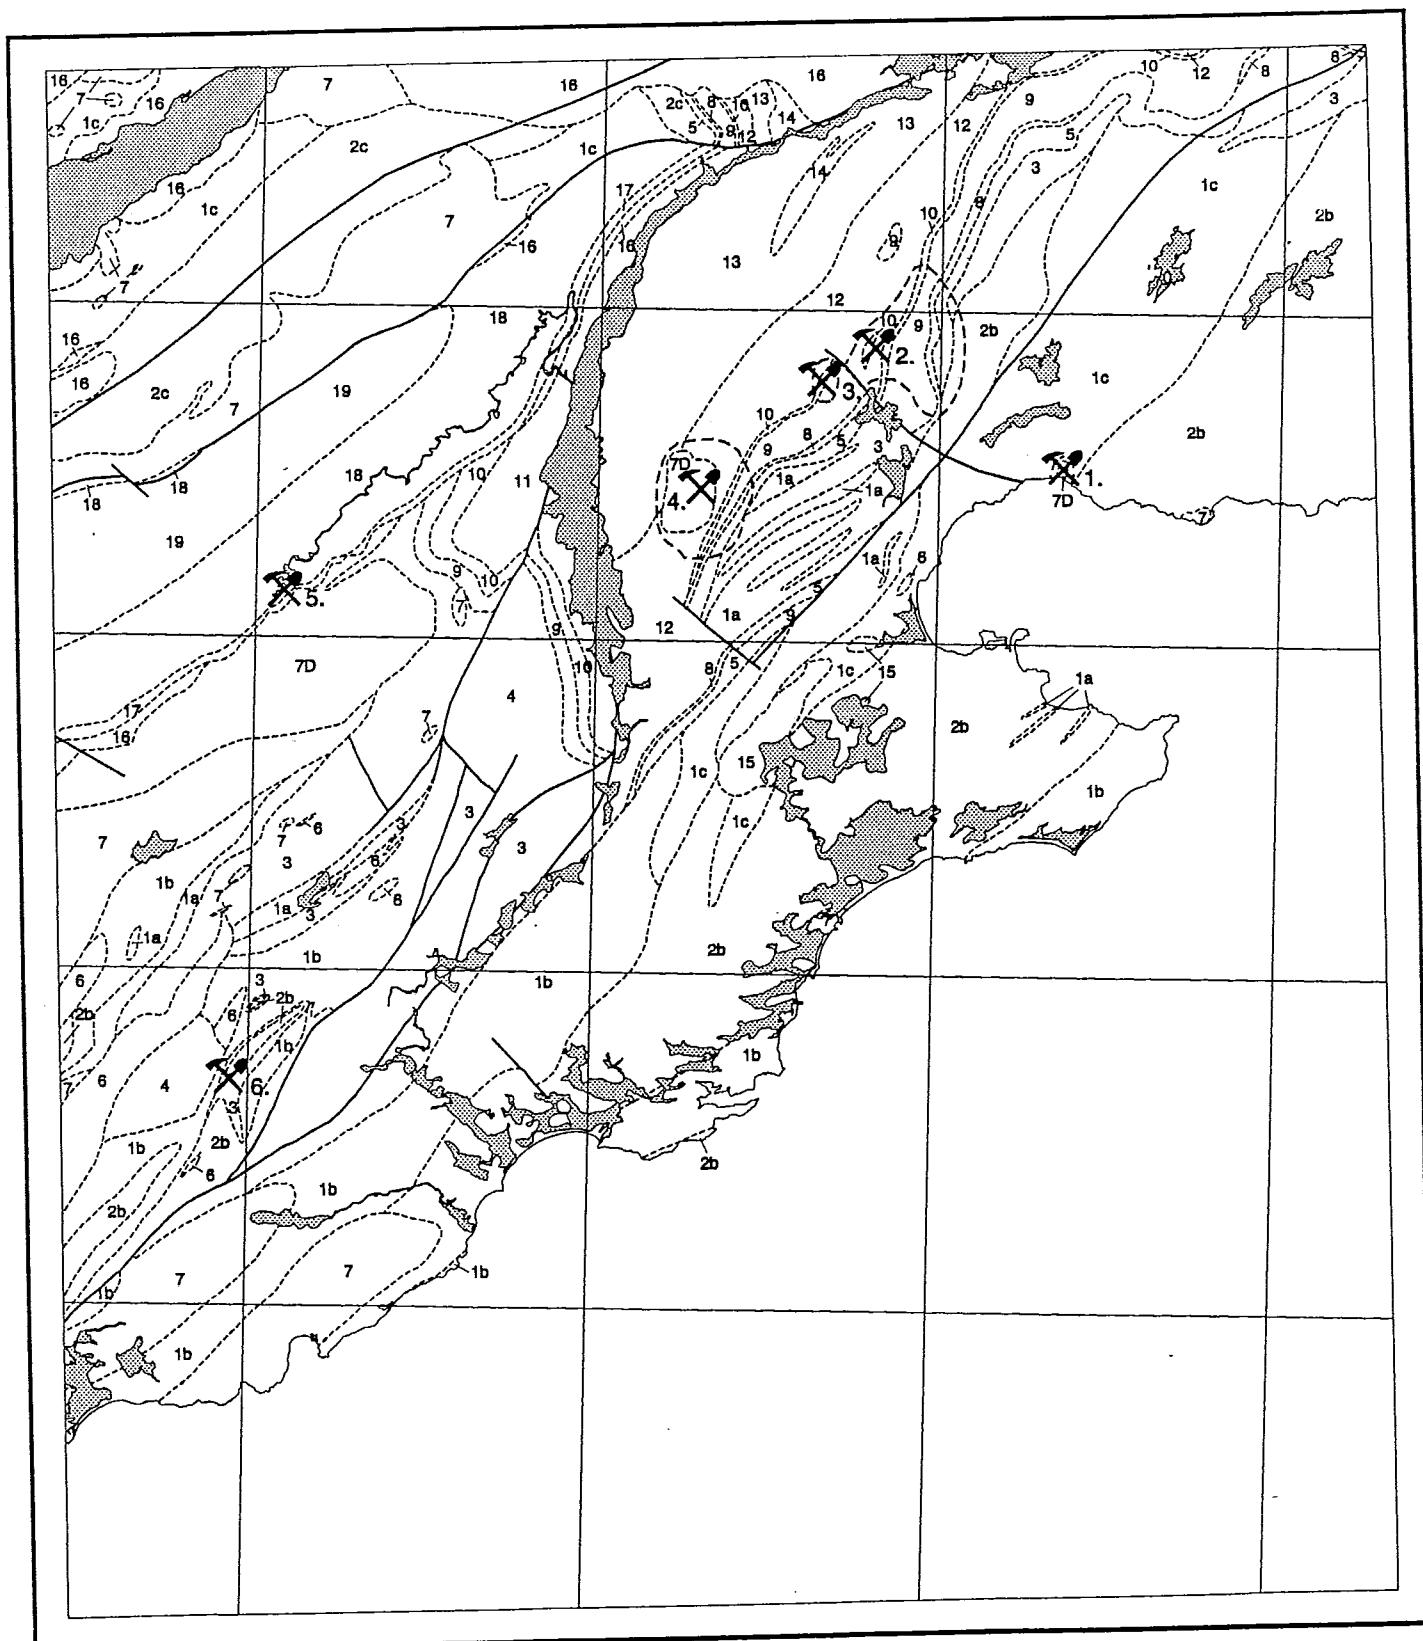

Figure 4. Bedrock geology of the Mira-Framboise area. Numbers 1 to 6 correspond to mineral occurrences listed in the legend on the following two pages. A clear film version of this map is included in the back pocket for overlaying on proportional symbol maps in appendices.

formations and Carboniferous clastic units in the Windsor Group (Barr et al. 1992). Plutonic rocks within the Fourchu Group are mainly late Precambrian to Cambrian in age (Cormier, 1972) except for the Salmon River rhyolite porphyry, the Gillis Mountain Pluton and the Deep Cove Pluton which are Devonian in age (Barr et al., 1990). Cambrian hornfelsic sedimentary rocks near Blue Mountain are believed to be contact metamorphic aureoles marking the positions of subjacent Devonian granite plutons (Sangster, 1988).

The strong northeast-southwest "grain" of the terrane is controlled by northeast-southwest oriented bedrock faults and bedrock ridges composed of the more resistant rock types, mainly the Fourchu Group rocks in the East Bay Hills and the Precambrian and Devonian granitic rocks and their contact metamorphic aureoles.

There are two abandoned mines in the study area, the Mindamar Mine (Zn-Pb-Cu massive sulphide deposit) at Stirling and the Yava Mine (sandstone-hosted Pb) at Silver Mine (Figure 4). Bedrock in the northeast part of the study area hosts several small Cu-Pb-Zn-Bi-Mo-Ag mineral occurrences within Devonian granitic rocks and their thermal aureoles, including: 1) the Deep Cove occurrence (Mo-Ag-Bi-Cu) in the Fortress of Louisbourg National Historic Park; 2) the Blue Mountain (MacDonald Lake; Sangster, 1988) occurrence (Pb-Zn), southeast of Marion Bridge; 3) the Gillis Mountain occurrence (Mo-Cu), east of the Mira River; and 4) the Copper Shaft occurrence (Cu-Bi), 1 km southwest of Blue Mountain (Figure 4). There are several other smaller showings of mainly pyritic mineralization throughout the study area, about which there is very little information published. Mineralized float boulders have been

found along the southern shore of Gabarus Bay, in the vicinity of Gull Cove (Macdonald, 1989).

Quaternary Geology

The surficial geology of the Mira-Framboise area was mapped by Grant (1988) at a scale of $1:250,000$, as part of the regional surficial mapping of Cape Breton Island. Striations and landforms indicate that the study area was affected by at least 3 major ice flow events during the Wisconsinan; an oldest flow to the east (ice flow 2 on Figure 5), a younger flow to the north-northeast (ice flow 3) and a youngest flow to the south-southeast (ice flow 4).

Most of the study area is covered by till except for the East Bay Hills, in the northwest corner. The highest point in the study, Sgurra Bhreac (700 m above sea level), is located there. In the south, large till ridges that are 1 to 8 km long, up to 0.5 km wide and 30 to 60 m high, trend eastward. These ridges are composed of red, silty till and were formed by older, eastward ice flow (ice flow 2). The surfaces of the ridges are covered in flutings oriented southeastward that were formed by the third, southeastward ice flow event (ice flow 4).

Southwest of southern end of the Mira River and in northeastern part of area, northeastward trending drumlins cover the surface. They were formed by the second, northeastward ice flow event (ice flow 3). Southwest of the Mira River, northwest-southeast flutings are superimposed on the drumlins. They were shaped by the final, south-southeastward ice flow event (ice flow 4).

As part of this study, coastal sections around Gabarus Bay and at several other locations as far south as St. Esprit Beach were examined in an attempt to relate the multiple tills exposed in the

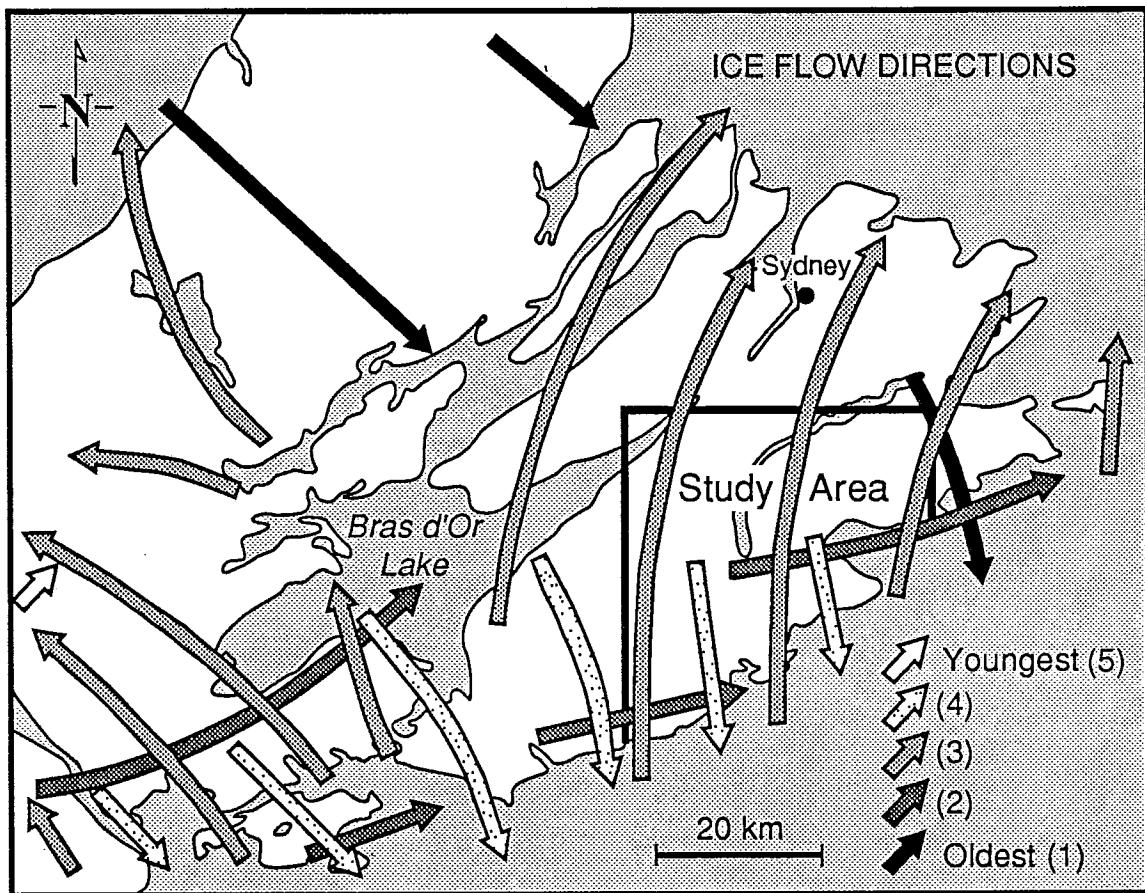

Figure 5. Regional ice flow patterns (modified from MacDonald et al. 1991; Grant, 1988).

sections to the complex ice flow history known from striations and surface features described above. The oldest till in the area is a grey, silty sand till that is exposed only at two sites near English Cove. It is silty till, which we interpret as resulting from the older eastward ice flow event (Figure 5). Most of the region is covered by the reddish, silty till that contains a mixture of local and distantly derived clasts. The red colour and fine-grained texture of this till are the result of erosion of Carboniferous sedimentary rocks to the west. In the southern part of the area, the red till is overlain by a discontinuous grey, sandy till composed mainly of locally derived clasts and varying in thickness from less than 0.5 m in the Stirling area to 3.0 m at Capelin Cove and St. Esprit Beach. Till fabric data indicate that the red, clay-rich till was deposited by ice flowing eastward (ice flow 2) and that it was remolded by north-northeastward flowing ice (ice flow 3). The sandy till cap was probably deposited by ice flowing north-northeastward (ice flow 3). These two phases of ice flow are recorded by striae on many outcrops exposed along the coast. Highland areas in the northern part of the study area have only a thin cover of locally derived stony, sandy till. This till was most likely deposited by ice flowing northward (ice flow 3).

The correlations of the till units and ice flow phases with those described by Stea et al. (1992) will be made in the final report.

METHODS

Sample Collection

Orientation studies completed in 1990 were used to determine which part of the soil profile developed on till was the best sampling medium for the regional till sampling program. Approximately 130

till samples were collected from 4 sections along the coast and from 25 smaller sections sampled in detailed around the Yava, Deep Cove, MacIntyre Lake, Copper Shaft, and Blue Mountain base metal occurrences. Results indicated that the <0.063 mm fraction of the C horizon is a useful fraction for analysis. The UTM easting and northing coordinates, and descriptions for the 1990 till samples are listed in Appendix A and site locations are shown in Figure 3. Till geochemical data are listed in Appendix B. These data were not used in the calculation of summary statistics or the plotting of regional geochemical maps.

In 1991, till samples (2 kg) were collected over the entire region as part of the regional survey and from 3 smaller areas overlying known bedrock mineralization (Figure 4). A total of 324 regional till samples were collected from sites 3 to 5 km apart, some of which correspond to regional biogeochemical sample sites, also sampled in 1991 by the Geological Survey of Canada (Dunn and Adcock, 1991). Till samples were collected from the C horizon of soil exposed in hand-dug surface pits 0.5 to 1.0 m deep. Sample sites were reached by vehicle using the existing network of roads and trails and by walking along the shoreline. The most remote areas were reached by helicopter. Regional till samples were collected for prospecting purposes, to establish regional background values of base and precious metals in drift and to identify anomalous areas that may indicate mineralization in the underlying or nearby bedrock.

An additional 169 till samples were collected from the C horizon of soil in hand-dug surface pits from closely spaced sites around an inactive base metal mine and 2 mineralized bedrock

occurrences (refer to location map in back pocket). These 3 areas were sampled in detail to document the nature of glacial dispersal from the mineralized sources, i.e., the directions and distance that successive ice flow events have dispersed material and the variation in trace element concentration in tills around the bedrock source. Around the former Mindamar base metal Mine at Stirling, 46 till samples were collected approximately 200 to 500 m apart in a 24 km² area. At four of the sites, an additional till sample was collected to compare the composition of the thin, discontinuous cover of sandy till to the underlying, red silty-clay till that blankets the area. A total of 51 till samples were collected in a 1.5 km² area around the Deep Cove Mo- Ag-Bi-Cu occurrence in the Fortress of Louisbourg National Historic Park. Five to six till samples were collected at 100 m spacings along each of seven lines oriented north-south and spaced 100 to 150 m apart. In the Blue Mountain (MacDonald Lake) area, 69 till samples were collected approximately 500 m apart within a 35 km² area.

At each regional and detailed grid site, one till sample and one pebble sample were collected and a brief site/pit description was made. Till characteristics recorded included: unit thickness; texture; colour; compaction; visible weathering/oxidation; structures present; and clast content. A photograph was taken of each regional sample site. The location of each sample site was recorded on a 1:50,000 topographic map. For the 3 detailed sampling areas, sample locations were recorded in the field on 1:10,000 colour aerial photographs. Sample locations, as UTM easting and northing coordinates, and descriptions are listed in Appendix A and a location map is provided in the back pocket (Figure 3).

Approximately 130 till samples were collected from 12 coastal sections along Gabarus Bay and at several locations as far south as St. Esprit Beach. At the sections, several vertically adjacent till samples were collected to characterize compositional variations within and between tills. Pebble samples were also collected from the sections but not for every till sample. At nine sections, till fabrics were measured. Detailed descriptions of the sections and sediments exposed were recorded, including unit thicknesses and the nature of contacts between tills and these are included in Appendix A.2. Sample locations are shown on Figure 3. Striations on coastal outcrops and in the vicinity of sections were measured and recorded on 1:50,000 topographic maps.

A total of 31 bedrock samples were collected from selected outcrops within the detailed till sampling areas at Blue Mountain and Deep Cove to document and compare the geochemical signatures of the mineralized bedrock to that of the till. Four mineralized boulders from the beach and one from the till at Gull Cove and one cobble from the borrow pit 1 km southwest of Framboise were also collected for geochemical analysis. Sample UTM easting and northing coordinates and descriptions are listed in Appendix A.3 and locations are shown on Figure 3.

Geochemical Analyses

The <0.063 mm till fraction was analyzed for 29 trace or minor elements (Table 1) by Bondar-Clegg and Company Ltd. of Ottawa, Ontario. The elements Al, Fe (total), Mg, Mn, Ca, K, Na, Sc, V, Cr, Co, Ni, Cu, Zn, As, Sr, Y, Mo, Ag, Cd, Sn, Sb, Te, Ba, La, W, Pb and Bi were analyzed by Inductively Coupled Plasma Spectroscopy (ICP)

Element	Analytical Method	Extraction	Lower Detection Limit
Al	ICP	HCl-HNO ₃ , 3:1	0.01%
Fe (total)	ICP	HCl-HNO ₃ , 3:1	0.01%
Mn	ICP	HCl-HNO ₃ , 3:1	1%

ICP Inductively Coupled Plasma spectroscopy

DCP Direct Current Plasma spectroscopy

Table 1. Analytical methods for till and bedrock samples

following a "partial" digestion in HCl and HNO₃. A 20 g split was analyzed for Au by fire assay preparation of a silver bead followed by Direct Current Plasma (DCP) analysis using an aqua regia digestion. Analytical procedures are described in detail in Appendix D.1.

Bedrock and boulder samples were analyzed for the same suite of elements as the till samples using the same methods described above. Analytical methods and lower detection limits for each element are summarized in Table 1 and are described in detail in Appendix D.1. Till geochemical data are listed in Appendix B and bedrock geochemical data are listed in Appendix C.

Analytical quality control was monitored using three Geological Survey of Canada "in house" standards (TCA-8010, TCA-8043 and SB-A) inserted into analytical batches at regular intervals (approximately every 15 samples) and duplicate analyses of field samples. The TCA standards are bulk till samples collected from the Geraldton area and are used to monitor the accuracy of the gold analyses at low (TCA-8043) and higher (TCA-8010) concentrations. SB-A standard is a bulk till sample collected from the Sisson Brook area of New Brunswick and is used to monitor the accuracy of base metal analyses. Results are listed in Appendix D.

Duplicate samples were used to monitor the precision of the analyses and the data are listed in Appendix D.3. The results indicated a problem with the Cd analyses; values are significantly different between duplicate samples. All till samples were reanalyzed for Cd by Bondar-Clegg. Only the second set of Cd values are reported in Appendix B. Both sets of Cd results for duplicate samples are listed in Appendix D.3.

Pebble Counts

Approximately 300 pebbles, measuring 1 to 5 cm in diameter, from each regional sample site and selected stratigraphic sections were classified into 15 rock type categories: 1) mafic to intermediate volcanic rocks; 2) felsic volcanic rocks; 3) rhyolite; 4) hornfels; 5) granite; 6) diorite; 7) quartzite; 8) vein quartz; 9) red and green sedimentary rocks; 10) purple sedimentary rocks; 11) greywacke; 12) felsic intrusive rocks; 13) mafic intrusive rocks; 14) limestone; 15) other. The first 14 categories reflect major bedrock types found within or to the west of the study area, whereas the "other" category includes rocks that could not be identified or lithologies that could not be placed in the other 14 categories. Pebble lithology abundance data are listed in Appendix E.

Data Evaluation

Geochemical values reported as less than the lower detection limit were reassigned values of one half the detection limit for calculation of summary statistics and plotting proportional symbol maps. Univariate statistics and frequency histograms for the till geochemical data and the number percent of selected pebble lithology groups were calculated using the Macintosh computer program StatViewII and are listed in appendices B (till) and E (pebbles).

The spatial distribution of the 1991 geochemical data and pebble lithology data for the regional till samples and for the 3 detailed sampling grids at Deep Cove, Stirling and Blue Mountain were plotted by Northwood Geoscience Ltd., Ottawa, Ontario. The dot diameters are proportional to concentrations at approximately 25,

50, 75, 90, 95, 99 and 100 percentile. Thirty proportional symbol maps of till geochemistry were generated: 1) 13 regional maps: Au, Cu, Pb, Zn, Cd, Ag, Mo, Fe, Mn, Ca, Sr, Bi, Ba; 2) 6 Deep Cove grid maps: Cu, Pb, Zn, Ag, Mo, As; 3) 6 Blue Mountain grid maps: Cu, Pb, Zn, Au, Ag, As; and 4) 5 Stirling grid maps: Cu, Pb, Zn, Au, Ca.

Proportional symbol maps for pebble lithologies were generated by combining some lithologic categories. The felsic intrusive pebble distribution map was produced by combining 3 categories, felsic intrusive, granite and diorite. The felsic volcanic distribution map was made by combining the felsic volcanic and rhyolite categories. Red, green, brown and purple sedimentary clasts were combined into one category because of the difficulties distinguishing between red and brown and between red and purple.

Proportional symbol maps are included in appendices B (till geochemistry) and E (pebble lithology data). A clear film map of the regional bedrock geology is provided in the back pocket which overlays each regional proportional symbol map. In order to compare the regional trace element and pebble lithology maps with those for the Deep Cove, Stirling and Blue Mountain areas, data for the 3 detailed grids were plotted using similar ranges of concentration as were used to plot the regional data. Therefore, samples that are anomalous on any of the detailed grid maps would also be anomalous if they had appeared on the regional maps.

RESULTS AND DISCUSSION

Regional Patterns

Anomalous gold concentrations in till are restricted to a small area of felsic volcanic rocks north of Gabarus Bay (Appendix B.2).

Although these rocks are shown as part of the Fourchu Group on Figure 4, they have recently been differentiated by Barr et al. (1992) as the late Precambrian to early Cambrian Main-a-Dieu sequence.

Anomalous lead and zinc levels in till are located in the Salmon River Valley, along the southern edge of the Silver Mine Formation which is the host rock for the Yava lead deposit. Moderately elevated lead levels also occur around Gillis Mountain, Copper Shaft and Blue Mountain. The few elevated arsenic levels are found near Gillis Mountain and Blue Mountain overlying middle Cambrian metasedimentary rocks. The highest copper, silver and bismuth levels in till are found overlying Cambrian metasedimentary rocks and Proterozoic Fourchu Group volcanic rocks north and west of Gabarus Bay.

Mineralized boulders found in till and on the beach along the southern shoreline of Gabarus Bay at Gull Cove, contain anomalous concentrations of arsenic and molybdenum and elevated levels of gold (Appendix C). One boulder, collected at the top of the exposed Quaternary sediment section at Gull Cove, contains elevated concentrations of Zn, As and Au.

In summary, several of the regional sample sites display combinations of anomalous concentrations of Au, Cu, As, Zn, Pb or Ag that are of interest to mineral exploration and warrant further investigation. Anomalous sites are located: 1) north and northeastward of Gillis Mountain; 2) in the vicinity of the Copper Shaft occurrence; 3) in the Canoe Lake area (approximately 5 km west of Gabarus Bay); 4) in the Blue Mountain area; 5) at Gull Cove, on the eastern shoreline of Gabrus Bay; 6) along the Salmon River valley, especially site 1060 which is located 1 km southwest of the

Yava Mine; and 7) the trench located in the southwest corner of area, overlying the northern boundary of Lower St. Esprit Granite (Rattling Brook area, data listed in Appendix B.6).

Detailed Grid Patterns

At Deep Cove, striations on coastal outcrops indicate that an early eastward ice flow (Figure 5, ice flow 2) was followed by a northward ice flow (Figure 5, ice flow 3). The highest Mo levels in till in the entire Mira-Framboise study area were found at this locality, covering an area of at least 1 km². All the metals present in the mineralized bedrock are enriched in the till. Anomalous levels of Mo, Cu, and Ag and, to a lesser extent Pb and Zn, occur in till at least 600 m east of the mineralized granite. This pattern indicates that the eastward ice flow was the dominant event and that the northward ice flow did not remobilize much of the metalliferous till. Drift prospecting in Mira-Framboise area will be aided by the interpretation of geochemical and other lithologic data in map form with the knowledge that the main till transport direction was eastward.

The Blue Mountain area, is covered by a thin, locally derived stony, sandy till. Elevated Cu concentrations in till occur across the detailed grid area. Anomalous Pb, Zn, As and Ag concentrations in till occur on the west side of the detailed sampling area, overlying Cambrian sedimentary rocks. This pattern may be the result of northward transport of debris from the Gillis Mountain and Blue Mountain mineral occurrences. Anomalous Au levels in till occur on the east side of the detailed sampling area overlying Fourchu Group

felsic volcanic rocks. These anomalous Au values occur in the same area as Au anomalies in the regional till samples.

The area of the Mindamar Mine at Stirling has a thick cover of reddish silty till derived from local bedrock and from Carboniferous sedimentary rocks west of the area. This till hampers drift prospecting where it is thick because its geochemistry reflects exotic bedrock sources to the west rather than local bedrock. When compared to the regional geochemical data set, till in the Stirling area is slightly enriched in Cu and Zn, forming an area of high background concentrations. Anomalous Au, Pb, Zn and Cu levels in till occur up to 1 km east and southeast of the mineralization, indicating that eastward glacial transport was the dominant event here.

ACKNOWLEDGMENTS

M.B. McClenaghan and R.N.W. DiLabio were assisted in the field by C.A. West and R.C. Paulen and in the office by O.E.G. Andrews. The regional till samples were collected by Northwood Geoscience Ltd. during the summer of 1991. Bondar-Clegg and Company Ltd. performed all geochemical analyses. Pebble counts for the regional till samples, proportional symbol maps and bedrock geology maps were completed by Northwood Geoscience Ltd.

R. R. Stea, M.A. MacDonald, and P.J. Rogers of the Nova Scotia Department of Natural Resources are thanked for their helpful discussions of the geology of the area. A.L. MacLain, Chief Warden at the Fortress of Louisbourg National Historic Park kindly provided access to the park and the use of an ATV and S. Lohnes gave valuable advice during work in the park. C.E. Dunn and S.W. Adcock, of Mineral Resources Division, GSC, were helpful in setting up the

logistics for the field work. I.M. Kettles is thanked for comments and suggested improvements to the manuscript. This project was funded by the Canada-Nova Scotia Cooperation Agreement for Mineral Development, 1990-1992.

**APPENDIX A.3 bedrock and float boulder sample locations
and descriptions**

Appendix A.3 Bedrock and boulder sample sites and descriptions

Sample Number	Location	Easting	Northing	Comments
91DD0A336	Deep Cove	723350	5085050	granite, with molybdenite
91DDA0337	Deep Cove	723350	5085050	basalt, quartz-sulphide veins
91DDA0352	Deep Cove	723350	5085050	basalt, sheared, quartz-sulphide veins
91DDA0353	Deep Cove	723350	5085050	granite, with molybdenite crystals (1-3 cm), contact with basaltic wall rock
91DDA0355	Deep Cove	723600	5085000	granite, with molybdenite
91DDA0356	Deep Cove	723600	5084950	large granite dyke, with cross-cutting quartz-molybdenite dykes
91DDA0358	Deep Cove	723650	5084950	basalt, with quartz veins containing molybdenite + minor sulphides
91DDA0360	Deep Cove	723700	5084950	basalt, with molybdenite
91DDA0361	Deep Cove	723800	5084900	felsic tuff, with molybdenite throughout
91DDA0368	Deep Cove	724050	5084740	basalt, with quartz-feldspar vein containing molybdenite
91DDA0369	Deep Cove	724470	5084430	basalt, with quartz-feldspar vein containing molybdenite
91DDA0370	Deep Cove	724850	5084100	basalt, with quartz vein containing molybdenite
91DDA0393	Deep Cove	723500	5085360	basalt
91DDA0438	Deep Cove	723900	5085200	float boulder/bedrock?, gneissic granite, with molybdenite
91DDA0439	Deep Cove	723900	5085100	float boulder, granite, visible sulphides
91DDA0477	Deep Cove	723700	5085200	granite, with sulphides, trace molybdenite in veins and fractures
91DDA0488	Framboise	704450	5065350	float cobble, mafic volcanic, disseminated sulphides throughout
91DDA0545	Gull Cove	726250	5077650	float boulder in till, at top of 20 m section, sulphides
91DDA0546	Gull Cove	726250	5077650	float boulder on beach, felsic volcanic, fine grained, disseminated sulphides
91DDA0547	Gull Cove	726250	5077650	float boulder on beach, purple, Fourchu Group volcaniclastic
91DDA0548	Gull Cove	726250	5077650	2 float boulders on beach, sediment? quartz vein, pyrite along bedding planes
91DDA0593	Blue Mountain	716300	5094050	grey shale, rusty partings and joints
91DDA0594	Blue Mountain	716650	5093000	grey, thinly bedded sandstone, abundant shale partings, some sulphides
91DDA0595	Blue Mountain	717000	5089150	grey slate, hornfelsed, rusty (limonite), some pyrite in joints & fractures
91DDA0596	Blue Mountain	717850	5089250	grey hornfels, sulphides along fractures
91DDA0597	Blue Mountain	717400	5088700	spotted grey hornfels, trace sulphides
91DDA0598	Blue Mountain	717300	5088500	spotted dark grey hornfels, massive texture
91DDA0599	Blue Mountain	717300	5088500	pink dacite porphyry
91DDA0600	Blue Mountain	717600	5089000	spotted grey hornfels, pyrite in fractures
91DDA0601	Blue Mountain	718600	5091000	grey slate

Appendix A.3 Bedrock and boulder sample sites and descriptions

Sample Number	Location	Easting	Northing	Comments
91DDA0602	Blue Mountain	719150	5090700	dark grey to black slate or hornfels
91DDA0603	Blue Mountain	719200	5090700	dark grey hornfels with disseminated sulphides
91DDA0604	Blue Mountain	719200	5090700	pink dacite porphyry dyke, with sulphides
91DDA0605	Blue Mountain	719000	5089800	knotted skarn
91DDA0606	Blue Mountain	719000	5089550	knotted skarn
91DDA0607	Blue Mountain	719000	5089450	spotted grey hornfels, with a few quartz veins; trace sulphides
91DDA0608	Blue Mountain	719100	5089150	spotted, very dark grey hornfels
91DDA0609	Blue Mountain	718900	5088500	spotted, very dark grey hornfels, grey-brown weathered surface

APPENDIX B. Till geochemical data for the <0.063 mm fraction, proportional symbol maps and summary statistics

LEGEND

Southeastern Cape Breton Island

CARBONIFEROUS

MORIEN GROUP

19 *GLENGARRY VALLEY AND BIG BARREN FORMATIONS:* green-grey and red polymictic conglomerate, sandstone, siltstone, shale, mudstone

RIVERSDALE GROUP

18 *SILVER MINE FORMATION:* grey-green and grey sandstone; grey-green and red mudstone, siltstone; minor coal

CANSO GROUP

17 *MACKEIGAN LAKE FORMATION:* grey shale, siltstone with gypsum, anhydrite; red shale

WINDSOR GROUP

16 *UIST, LOCH LOMOND AND ENON FORMATIONS:* red siltstone, sandstone, conglomerate with intercalated limestone, dolostone, gypsum, anhydrite; includes basal conglomerate

15 Undivided

CAMBRIAN

LATE CAMBRIAN

14 *MACNEIL FORMATION:* grey shale, siltstone; black limestone

MIDDLE CAMBRIAN

13 *MACLEAN BROOK FORMATION:* grey quartz sandstone, siltstone, shale

12 *TROUT BROOK FORMATION:* grey to red-brown cleaved shale and siltstone

11 undivided

EARLY CAMBRIAN

10 *CANOE BROOK FORMATION:* red-brown calcareous mudstone, siltstone; rare pink limestone

9 *MACCODRUM FORMATION:* light grey to green micaceous siltstone, sandstone

8 white quartz arenite

LATE PRECAMBRIAN TO DEVONIAN

INTRUSIVE ROCKS

7 Felsic Intrusives: 7, Precambrian Intrusive units including Chisholm Brook granodiorite, quartz monzonite; Capelin Cove leucogranite; Belfry Gut granite; Lower St. Esprit granite; Huntington Mtn. granite.
7D 7D, Devonian Intrusive units Including Gillis Mtn. granite, monzodiorite; Deep Cove granite; Salmon River rhyolite porphyry

6 Mafic Intrusives: Precambrian units including Chisholm Brook diorite; gabbro; mafic porphyry

5

maroon to red quartzite, quartz pebble conglomerate;
micaceous sandstone

4

KELVIN GLEN FORMATION: orange arkosic sandstone; purple to
grey wacke; micaceous red sandstone

FOURCHU GROUP (INCLUDING UNITS OF THE MAIN A DIEU
SEQUENCE AND COASTAL AND STIRLING BELTS)

3

Volcanogenic Sediments: volcanic conglomerate, wacke,
siltstone intercalated with volcanic flow and pyroclastic units

2

Intermediate to Felsic Volcanics: 2a, dacitic to rhyolitic flows; 2b,
dacitic to rhyolitic tuff, quartz-feldspar crystal tuff; 2c, undivided

1

Mafic to Intermediate Volcanics: 1a, basalt to andesite flows; 1b,
tuff, lapilli tuff, basalt to andesite lithic crystal tuff; 1c, undivided

- Geological boundary (approximate or assumed) 
- Regional fault 
- Contact metamorphic aureole 
- Metallic mineral occurrence 

INDEX TO METALLIC MINERAL OCCURRENCES

1. Deep Cove (Cu, Mo, Zn, Ag, Bi)
2. MacDonald Lake (Pb, Zn)
3. Copper Shaft (Cu, Zn, Pb, Mo, Ag, Bi)
4. Gillis Mountain (Cu, Mo)
5. Yava (Pb)
6. Stirling (Zn, Pb, Cu, Ag, Au)

LEGEND

Blue Mountain Area

CAMBRIAN

LATE CAMBRIAN

14

MACNEIL FORMATION: grey shale, siltstone; black limestone

MIDDLE CAMBRIAN

13

MACLEAN BROOK FORMATION: grey quartz sandstone, siltstone, shale

12

TROUT BROOK FORMATION: grey to red-brown cleaved shale and siltstone

EARLY CAMBRIAN

10

CANOE BROOK FORMATION: red-brown calcareous mudstone, siltstone; rare pink limestone

9

MACCODRUM FORMATION: light grey to green micaceous siltstone, sandstone

8

white quartz arenite

LATE PRECAMBRIAN TO EARLY CAMBRIAN

5

maroon to red quartzite, quartz pebble conglomerate; micaceous sandstone

FOURCHU GROUP (INCLUDING UNITS OF THE MAIN A DIEU SEQUENCE AND COASTAL AND STIRLING BELTS)

3

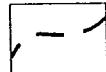

Volcanogenic Sediments: volcanic conglomerate, wacke, siltstone intercalated with volcanic flow and pyroclastic units

2

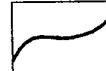

Intermediate to Felsic Volcanics: 2a, dacitic to rhyolitic flows; 2b, dacitic to rhyolitic tuff, quartz-feldspar crystal tuff; 2c, undivided

1

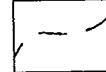

Mafic to Intermediate Volcanics: 1a, basalt to andesite flows; 1b, tuff, lapilli tuff, basalt to andesite lithic crystal tuff; 1c, undivided

contact metamorphic aureole

fault

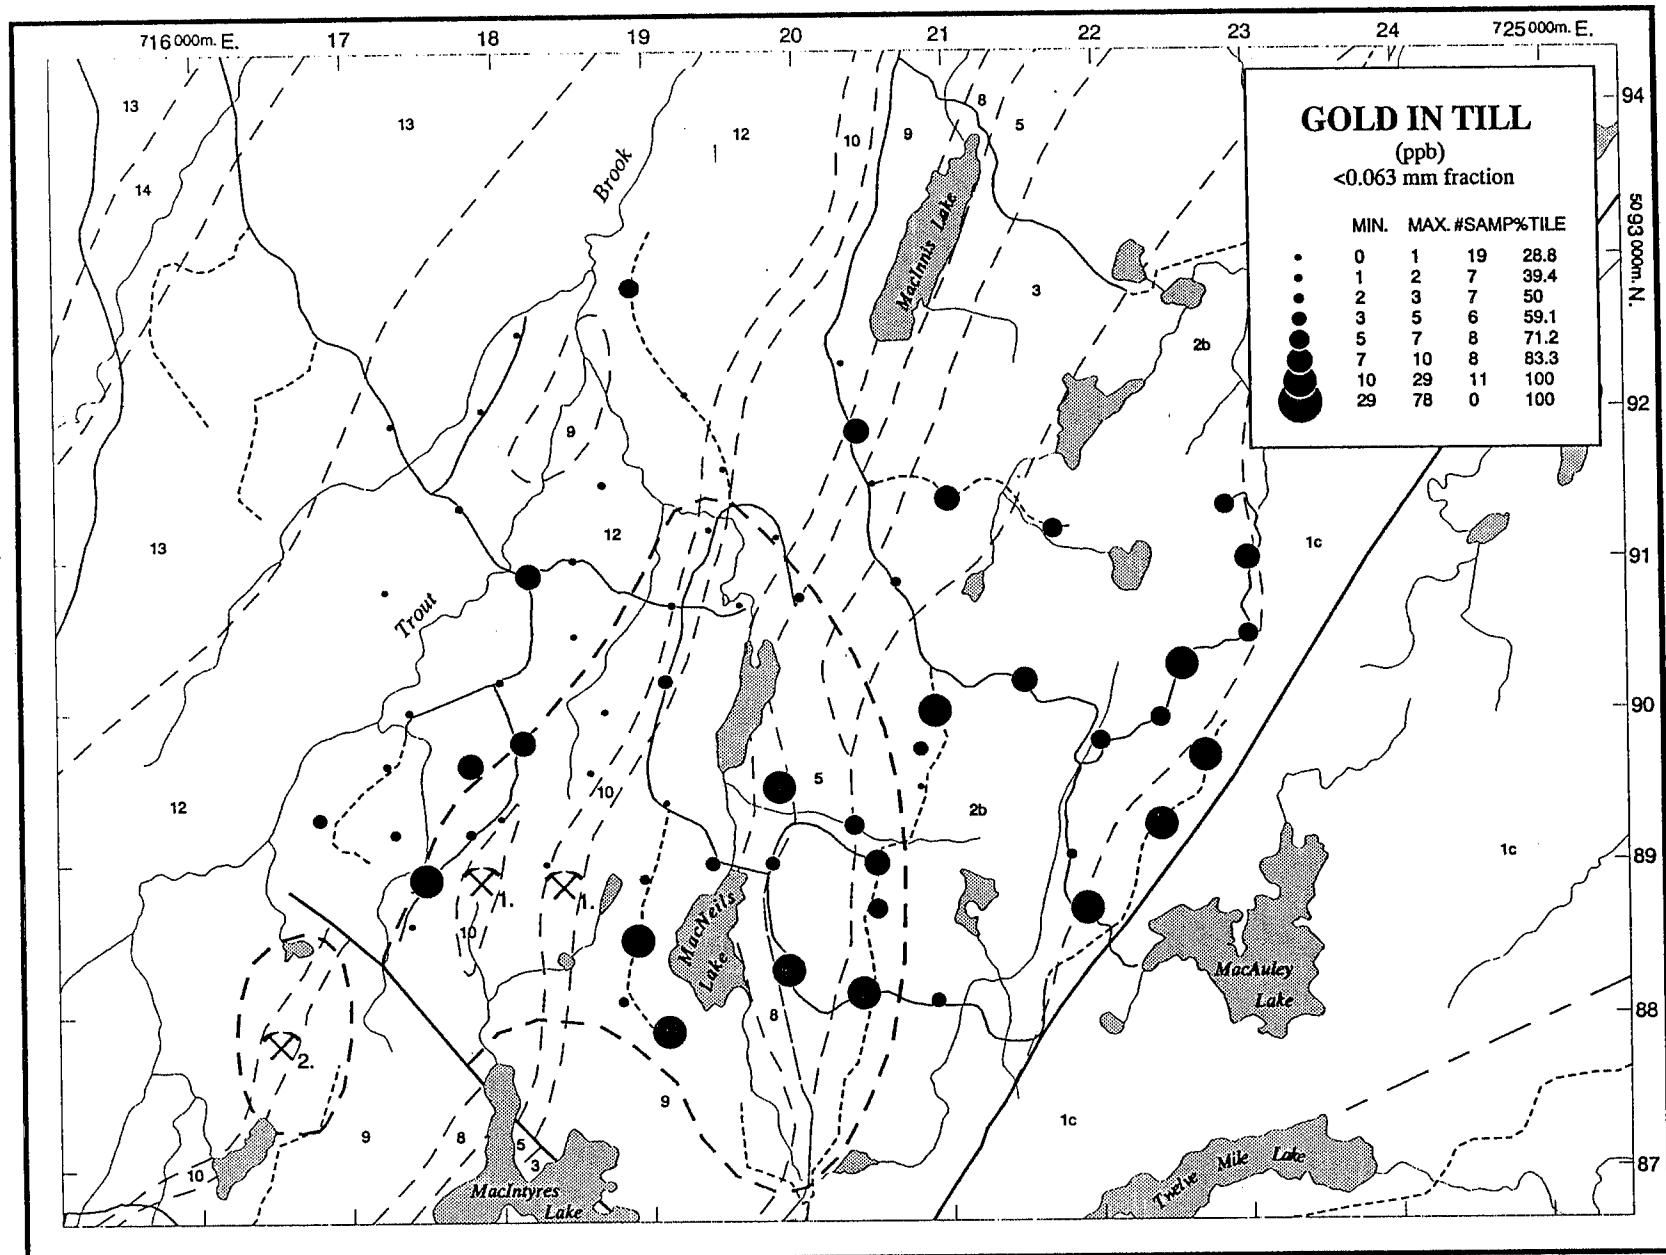

geological boundary

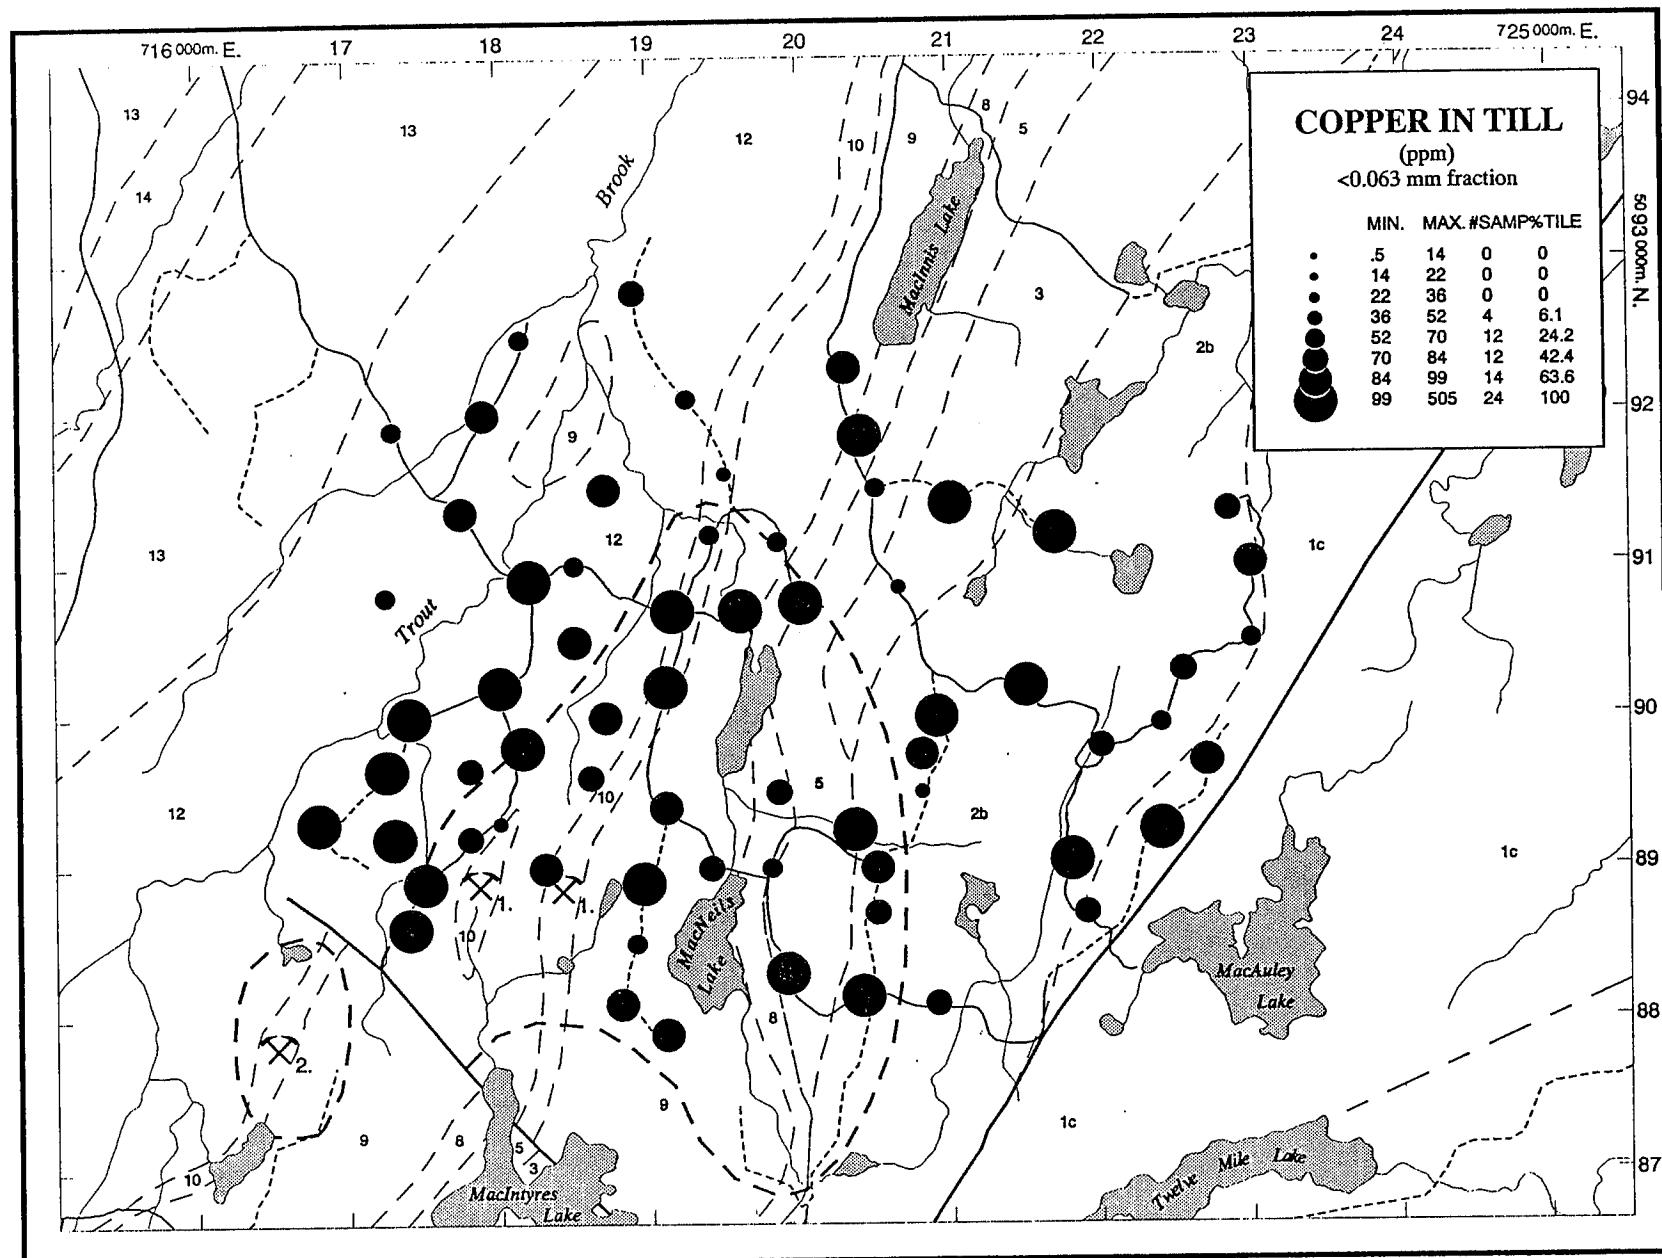

metallic mineral occurrence

1. Macdonald Lake Pb-Zn
2. Copper Shaft Cu-Zn-Pb-Mo-Ag-Bi

LEGEND

Stirling Area

LATE PRECAMBRIAN

INTRUSIVE ROCKS

6

Mafic Intrusives: includes gabbro; mafic porphyry

LATE PRECAMBRIAN TO EARLY CAMBRIAN

4

KELVIN GLEN FORMATION: orange arkosic sandstone; purple to grey wacke; micaeous red sandstone

FOURCHU GROUP (INCLUDING UNITS OF THE MAIN À DIEU SEQUENCE AND COASTAL AND STIRLING BELTS)

3

Volcanogenic Sediments: volcanic conglomerate, wacke, siltstone intercalated with volcanic flow and pyroclastic units

2

Intermediate to Felsic Volcanics: **2a**, dacitic to rhyolitic flows; **2b**, dacitic to rhyolitic tuff, quartz-feldspar crystal tuff; **2c**, undivided

1

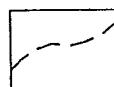

Mafic to Intermediate Volcanics: **1a**, basalt to andesite flows; **1b**, tuff, lapilli tuff, basalt to andesite lithic crystal tuff; **1c**, undivided

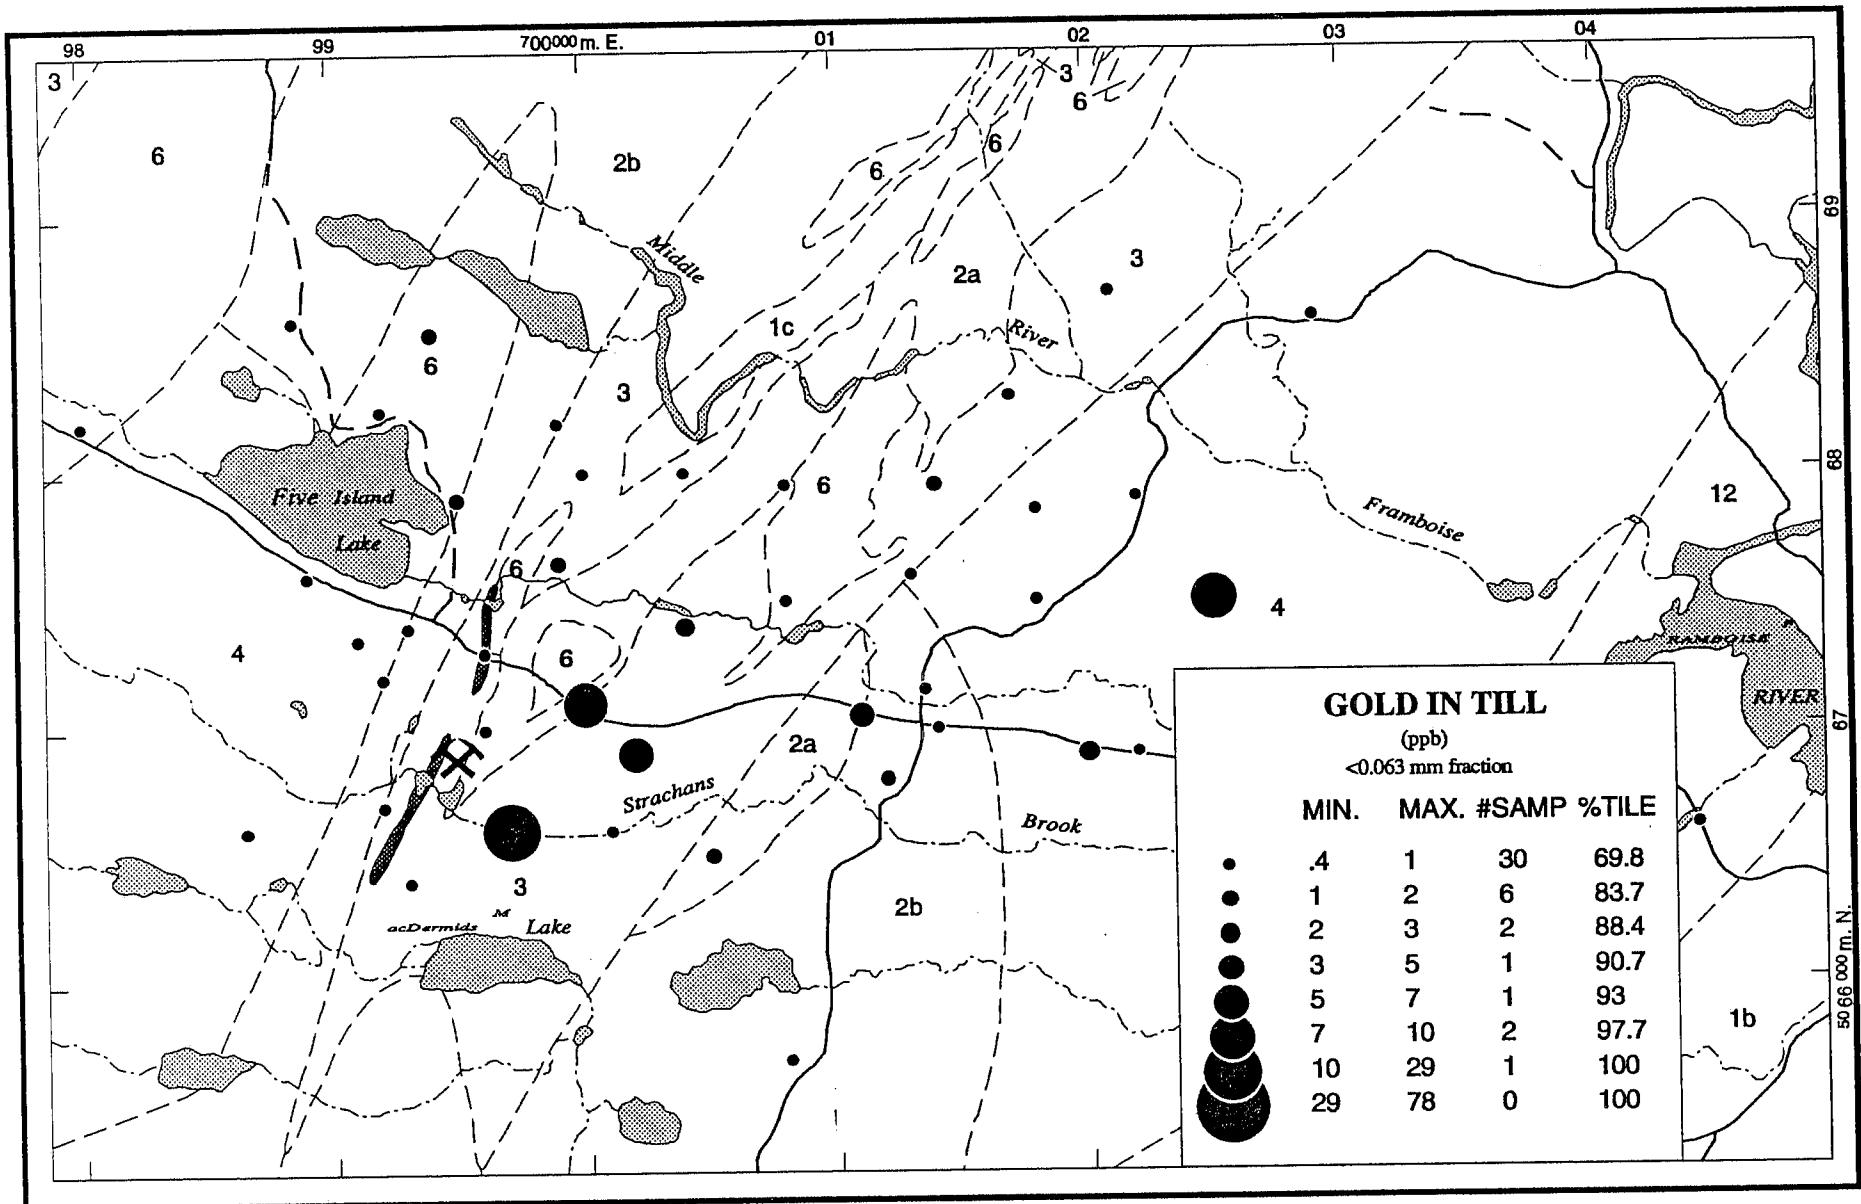

quartz-carbonate schist (alteration and/or chemical precipitates)

Mindamar Mine (Zn, Pb, Cu, Au, Ag)

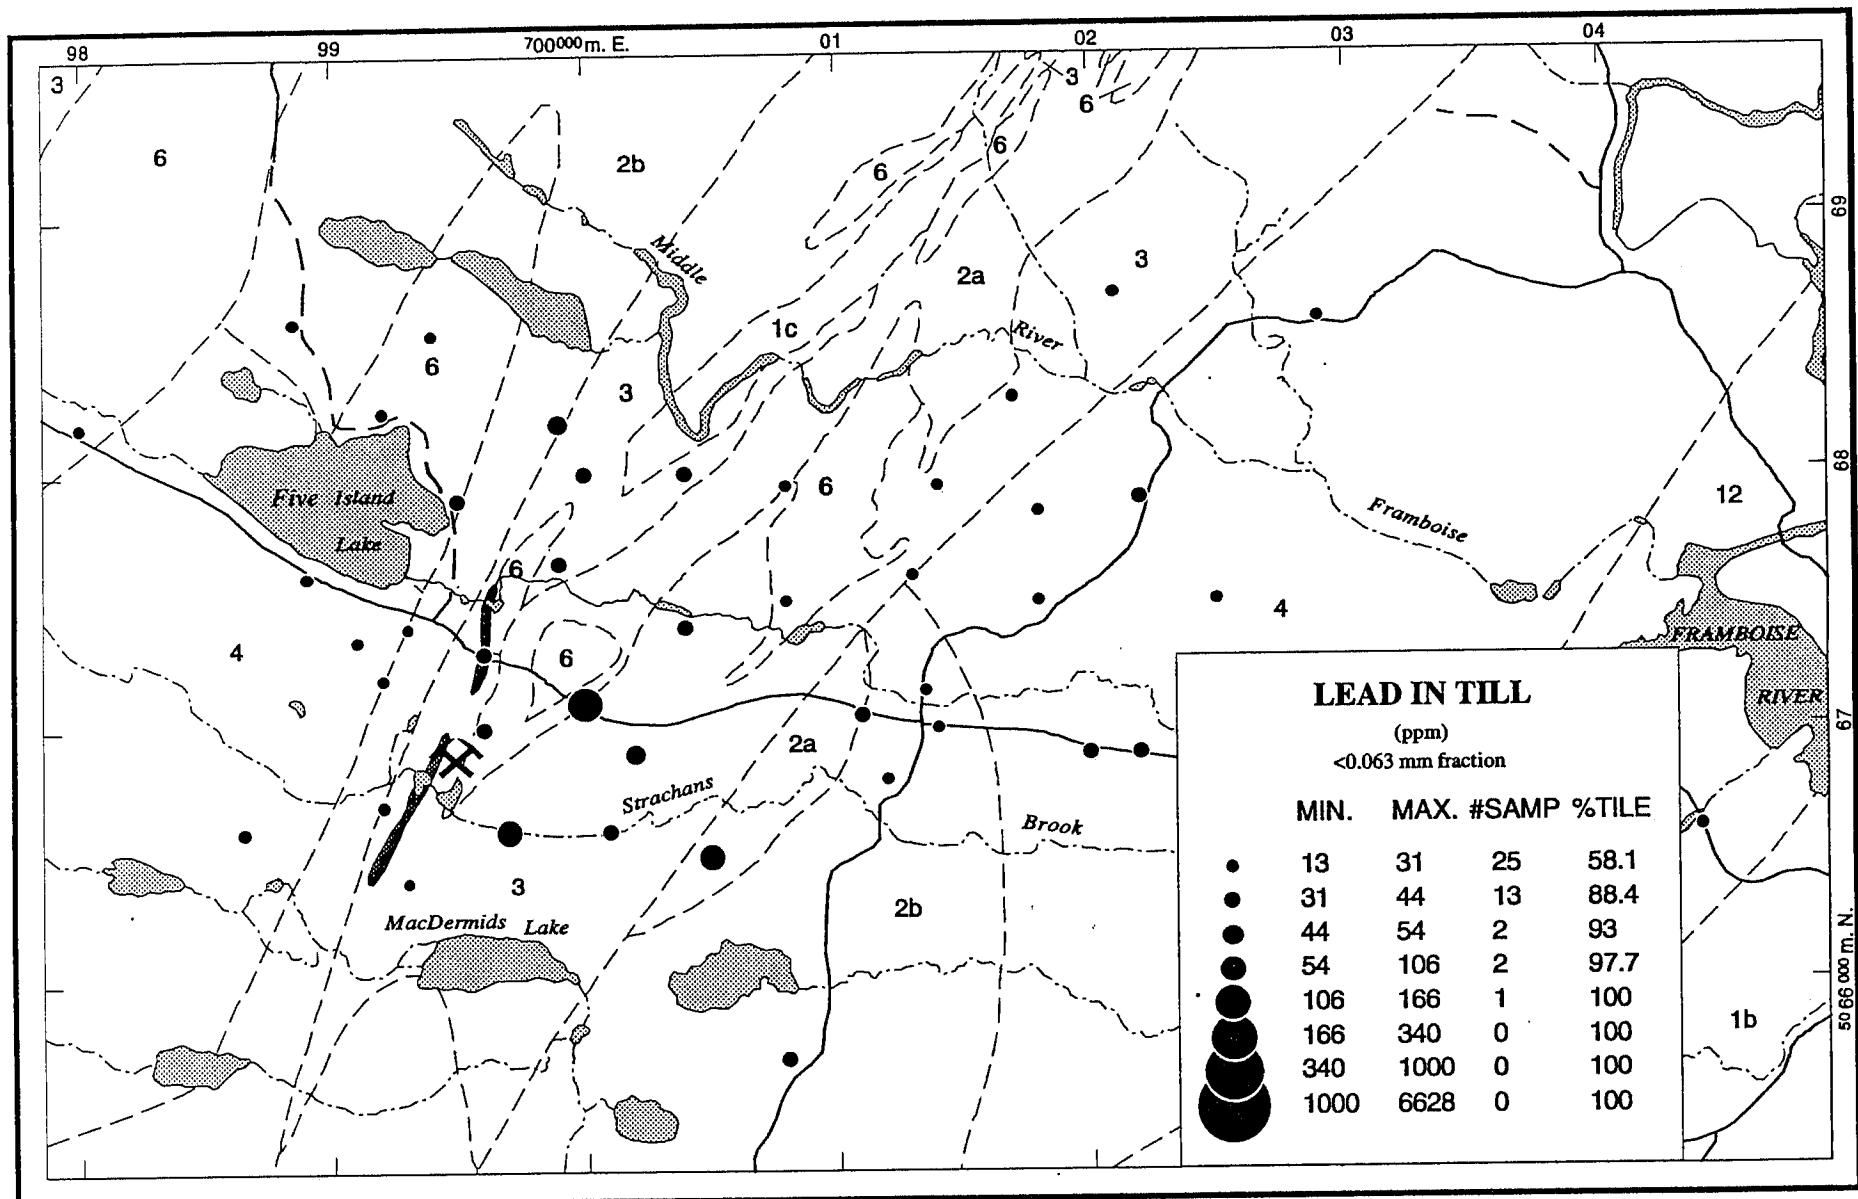

geological boundary

APPENDIX D.1 Till and bedrock analytical methods

Appendix D.1 Analytical Methods

Determination of gold by fire assay lead collection-Direct Current Plasma Emission Spectroscopy

A 20 g portion of sample is used for the lead-silver fire assay collection. Briefly, the sample is fused with a lead oxide flux containing 4 mg of silver at 1050 °C for 45 minutes. The melts are poured into cast iron molds and when cooled, the silicate slag is separated from the lead button. The button contains the precious metals, including silver and gold. Lead buttons are placed in magnesia cupels and heated to 800 °C for approximately 1 hour. The lead is absorbed into the cupel leaving the precious metals on the surface of the cupel as a doré bead. The beads are transferred to test tubes and digested with 0.2 ml HNO₃ for 20 minutes followed by 0.4 ml aqua regia (3:1 HCl:HNO₃) for 1 hour. The gold concentration of the solutions are then determined by Direct Current Plasma Emission Spectroscopy.

Determination of trace elements by Inductively Coupled Plasma Emission Spectroscopy

A 0.100 g portion of sample is weighed, placed into a glass test tube and digested with 0.5 ml of HNO₃ and 1.5 ml of HCl for 2 hours in a 90 °C water bath. Then, 8.0 ml of distilled water is added to make up the final volume of 10 ml and the solution is shaken on a vortex mixer to mix the solution thoroughly. Solutions are then measured on a Jarrell-Ash Inductively Coupled Plasma Emission Spectrometer and the final result is calculated based on the initial sample weight.

**APPENDIX E. Pebble lithology data for the 1-5 cm fraction,
proportional symbol maps and summary statistics**

	page
E.1 Regional data.....	187
E.2 Deep Cove detailed grid data.....	207
E.3 Blue Mountain detailed grid data.....	215
E.4 Stirling area detailed grid data.....	227
E.5 Stratigraphic section data.....	239

Legend for pebble lithology data listing

Mafic Volc = mafic volcanic rock
Felsic Volc = felsic volcanic rock
Rhy = rhyolite
Hnfls = hornfels
Grnte = granite
Dte = diorite
Qtzite = quartzite
Vein Quartz = vein quartz
R,Gr,Br seds = red, green and brown sedimentary rocks
Ppl Seds = purple sedimentary rocks
Gy,Bk Seds = grey and black sedimentary rocks
Grywke = greywacke
Felsic Intr = felsic intrusive rock
Mafic Intr = mafic intrusive rock
Lmst = limestone, dolomite

**APPENDIX E.1 Regional till sample pebble lithology data
for the 1-5 cm fraction**

	page
Data listing.....	189
Summary statistics.....	198
Proportional symbol maps*	
Bedrock map legend.....	199
Mafic Volcanic clasts.....	201
Felsic volcanic clasts.....	202
Red, green, brown and purple sedimentary rocks.....	203
Quartzite and greywacke clasts.....	204
Grey and black sedimentary rocks.....	205
Felsic intrusive clasts.....	206

*clear film overlay of bedrock geology in back pocket

Appendix E.1 Summary statistics for pebble lithology data for regional till samples

Lithology	Mafic volcanic clasts	Felsic volcanic clasts	Felsic intrusive clasts	Red, green, brown and purple sediments	Grey and black sedimentary rocks	Quartzites and greywacke clasts
Number of samples	325	325	325	325	325	325
Minimum	0.0	0.0	0.0	0.0	0.0	0.0
Maximum	93.8	87.0	88.0	99.5	83.6	95.0
Mean	30.45	11.47	7.56	23.51	NA	21.59
Standard Deviation	26.60	16.08	14.64	28.79	NA	23.65
Coefficient of Variation	87.35	140.15	193.54	122.44	NA	109.57
Skewness	0.52	2.59	3.41	1.37	NA	1.42
Kurtosis	-0.89	7.03	12.80	0.58	NA	1.28
Geometric Mean	8.42	2.79	0.56	6.97	NA	5.74

NA not applicable, most values are zero

LEGEND

Southeastern Cape Breton Island

199

CARBONIFEROUS

MORIEN GROUP

- | | |
|----|--|
| 19 | <i>GLENGARRY VALLEY AND BIG BARREN FORMATIONS:</i> green-grey and red polymictic conglomerate, sandstone, siltstone, shale, mudstone |
|----|--|

RIVERSDALE GROUP

- | | |
|----|---|
| 18 | <i>SILVER MINE FORMATION:</i> grey-green and grey sandstone; grey-green and red mudstone, siltstone; minor coal |
|----|---|

CANSO GROUP

- | | |
|----|--|
| 17 | <i>MACKEIGAN LAKE FORMATION:</i> grey shale, siltstone with gypsum, anhydrite; red shale |
|----|--|

WINDSOR GROUP

- | | |
|----|---|
| 16 | <i>UIST, LOCH LOMOND AND ENON FORMATIONS:</i> red siltstone, sandstone, conglomerate with intercalated limestone, dolostone, gypsum, anhydrite; includes basal conglomerate |
|----|---|

- | | |
|----|-----------|
| 15 | Undivided |
|----|-----------|

CAMBRIAN

LATE CAMBRIAN

- | | |
|----|--|
| 14 | <i>MACNEIL FORMATION:</i> grey shale, siltstone; black limestone |
|----|--|

MIDDLE CAMBRIAN

- | | |
|----|---|
| 13 | <i>MACLEAN BROOK FORMATION:</i> grey quartz sandstone, siltstone, shale |
|----|---|

- | | |
|----|---|
| 12 | <i>TROUT BROOK FORMATION:</i> grey to red-brown cleaved shale and siltstone |
|----|---|

- | | |
|----|-----------|
| 11 | undivided |
|----|-----------|

EARLY CAMBRIAN

- | | |
|----|---|
| 10 | <i>CANOE BROOK FORMATION:</i> red-brown calcareous mudstone, siltstone; rare pink limestone |
|----|---|

- | | |
|---|--|
| 9 | <i>MACCODRUM FORMATION:</i> light grey to green micaceous siltstone, sandstone |
|---|--|

- | | |
|---|----------------------|
| 8 | white quartz arenite |
|---|----------------------|

LATE PRECAMBRIAN TO DEVONIAN

INTRUSIVE ROCKS

- | | |
|---------|---|
| 7
7D | Felsic Intrusives: 7, Precambrian Intrusive units Including Chisholm Brook granodiorite, quartz monzonite; Capelin Cove leucogranite; Belfry Gut granite; Lower St. Esprit granite; Huntington Mtn. granite.
7D, Devonian Intrusive units Including Gillis Mtn. granite, monzodiorite; Deep Cove granite; Salmon River rhyolite porphyry |
|---------|---|

- | | |
|---|--|
| 6 | Mafic Intrusives: Precambrian units Including Chisholm Brook diorite; gabbro; mafic porphyry |
|---|--|

5

maroon to red quartzite, quartz pebble conglomerate;
micaceous sandstone

4

KELVIN GLEN FORMATION: orange arkosic sandstone; purple to
grey wacke; micaeous red sandstone

3

FOURCHU GROUP (INCLUDING UNITS OF THE MAIN A DIEU
SEQUENCE AND COASTAL AND STIRLING BELTS)

2

Volcanogenic Sediments: volcanic conglomerate, wacke,
siltstone intercalated with volcanic flow and pyroclastic units

1

Intermediate to Felsic Volcanics: 2a, dacitic to rhyolitic flows; 2b,
dacitic to rhyolitic tuff, quartz-feldspar crystal tuff; 2c, undivided

Mafic to Intermediate Volcanics: 1a, basalt to andesite flows; 1b,
tuff, lapilli tuff, basalt to andesite lithic crystal tuff; 1c, undivided

Geological boundary (approximate or assumed)

Regional fault

Contact metamorphic aureole

Metallic mineral occurrence

INDEX TO METALLIC MINERAL OCCURRENCES

1. Deep Cove (Cu, Mo, Zn, Ag, Bi)
2. MacDonald Lake (Pb, Zn)
3. Copper Shaft (Cu, Zn, Pb, Mo, Ag, Bi)
4. Gillis Mountain (Cu, Mo)
5. Yava (Pb)
6. Stirling (Zn, Pb, Cu, Ag, Au)

LEGEND

Blue Mountain Area

CAMBRIAN

LATE CAMBRIAN

14

MACNEIL FORMATION: grey shale, siltstone; black limestone

MIDDLE CAMBRIAN

13

MACLEAN BROOK FORMATION: grey quartz sandstone, siltstone, shale

12

TROUT BROOK FORMATION: grey to red-brown cleaved shale and siltstone

EARLY CAMBRIAN

10

CANOE BROOK FORMATION: red-brown calcareous mudstone, siltstone; rare pink limestone

9

MACCODRUM FORMATION: light grey to green micaceous siltstone, sandstone

8

white quartz arenite

LATE PRECAMBRIAN TO EARLY CAMBRIAN

5

maroon to red quartzite, quartz pebble conglomerate; micaceous sandstone

FOURCHU GROUP (INCLUDING UNITS OF THE MAIN A DIEU SEQUENCE AND COASTAL AND STIRLING BELTS)

3

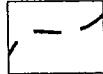

Volcanogenic Sediments: volcanic conglomerate, wacke, siltstone intercalated with volcanic flow and pyroclastic units

2

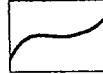

Intermediate to Felsic Volcanics: 2a, dacitic to rhyolitic flows; 2b, dacitic to rhyolitic tuff, quartz-feldspar crystal tuff; 2c, undivided

1

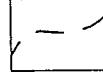

Mafic to Intermediate Volcanics: 1a, basalt to andesite flows; 1b, tuff, lapilli tuff, basalt to andesite lithic crystal tuff; 1c, undivided

contact metamorphic aureole

fault

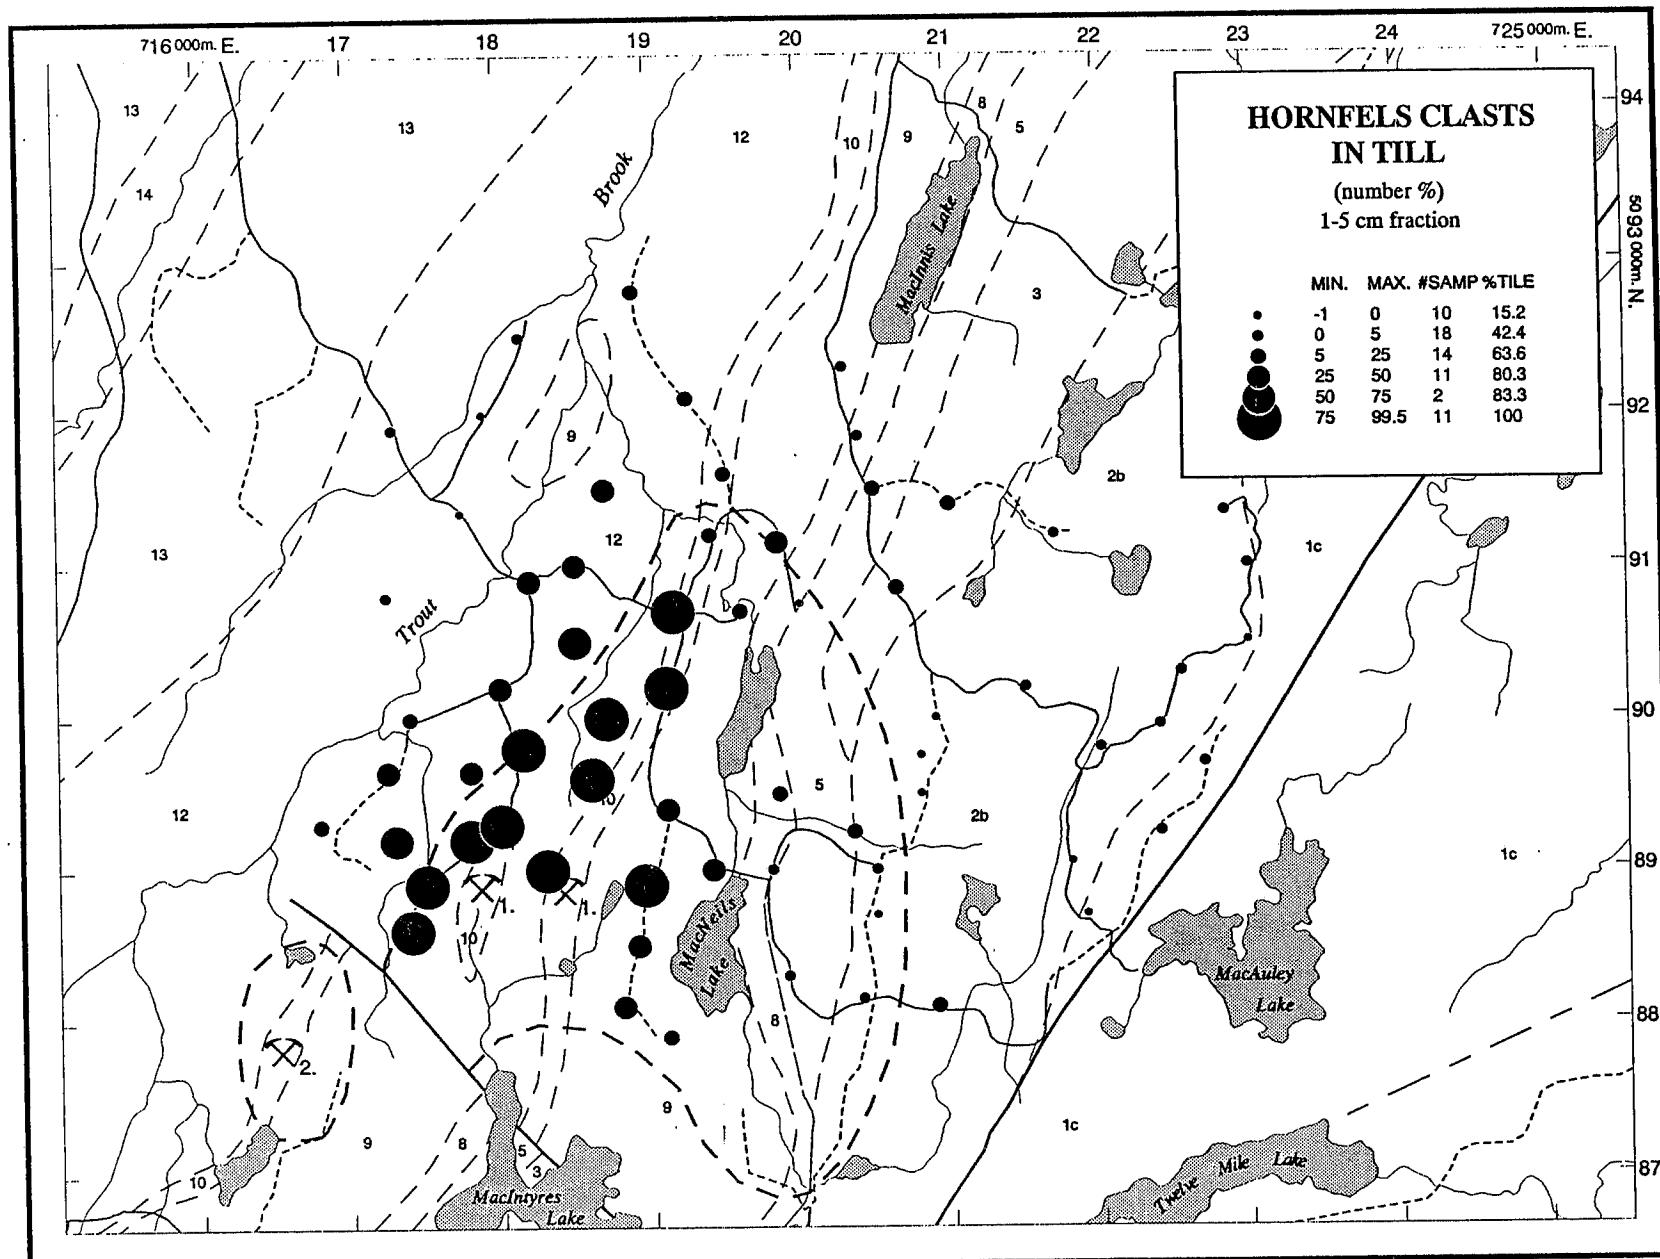

geological boundary

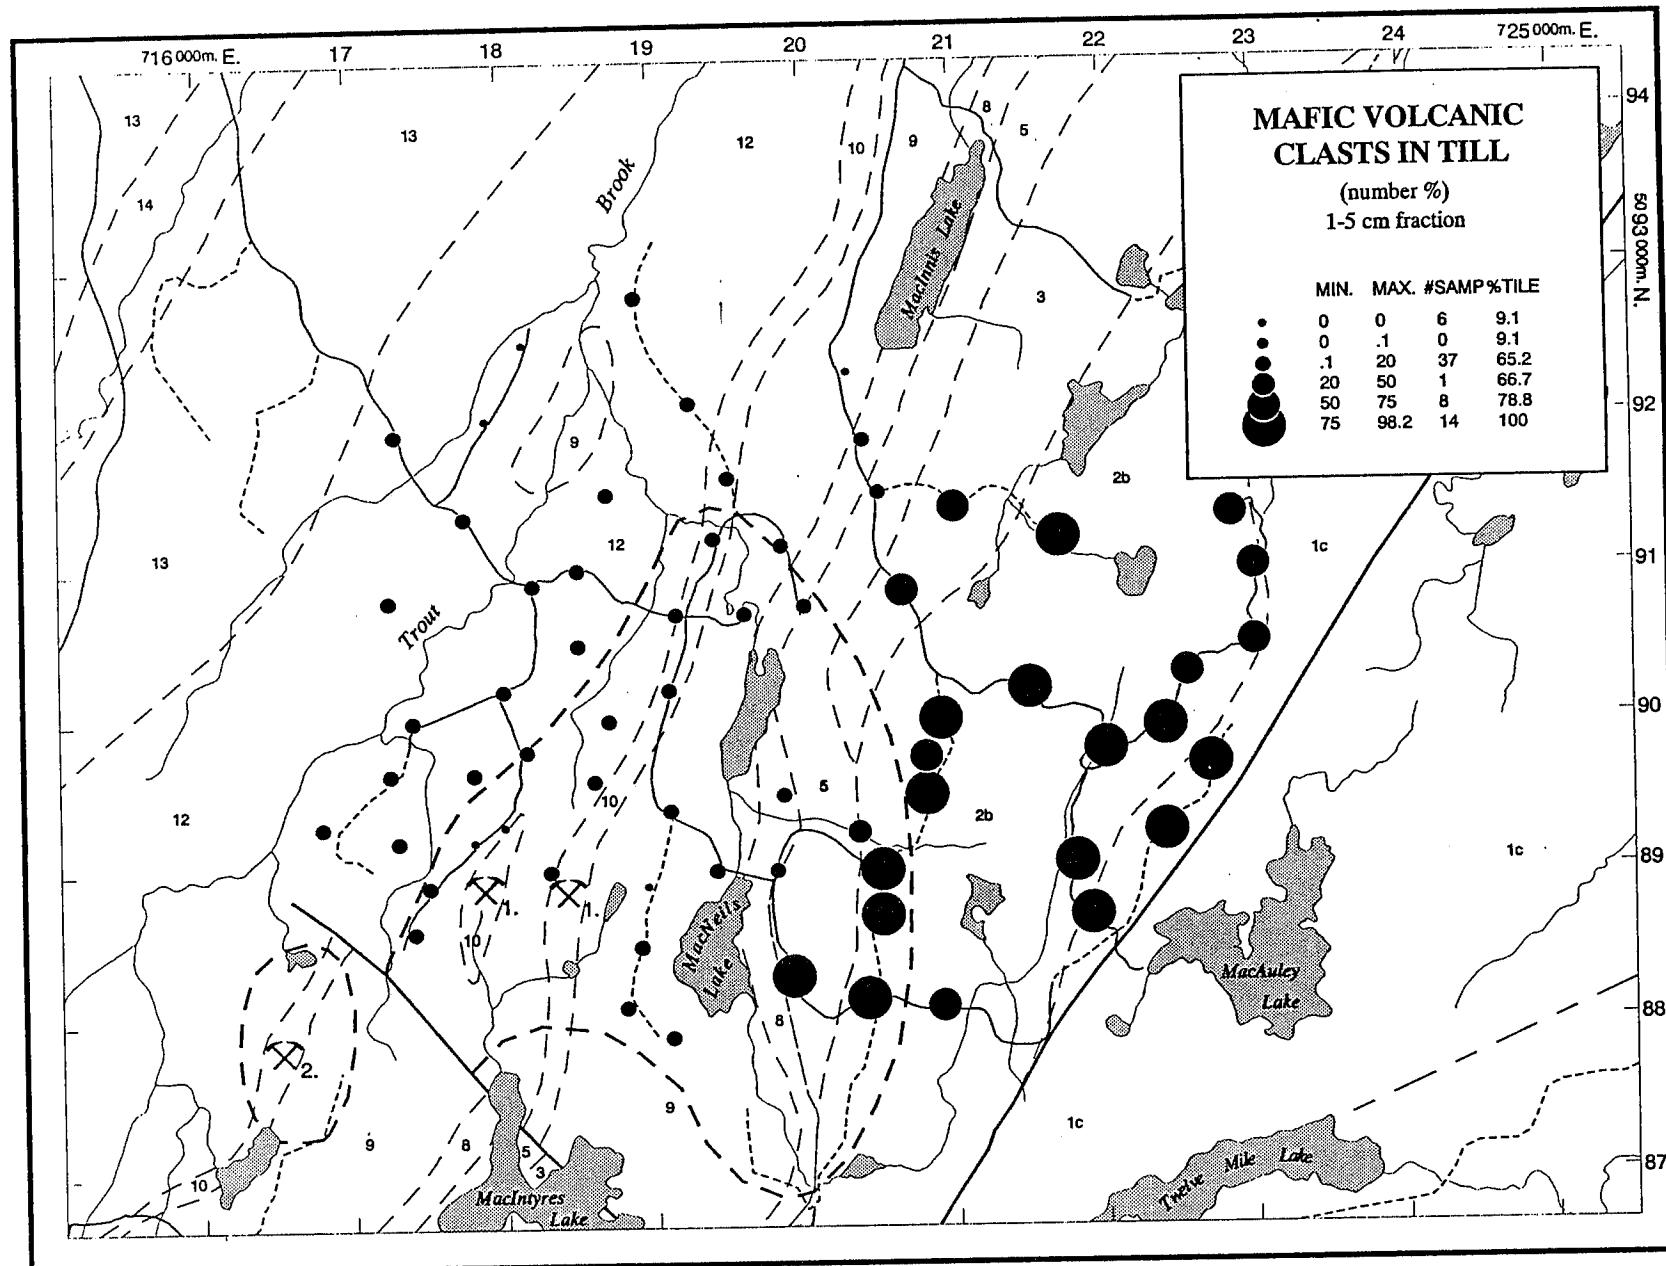

metallic mineral occurrence

1. Macdonald Lake Pb-Zn
2. Copper Shaft Cu-Zn-Pb-Mo-Ag-Bi

L E G E N D

Stirling Area

LATE PRECAMBRIAN

INTRUSIVE ROCKS

6

Mafic Intrusives: includes gabbro; mafic porphyry

LATE PRECAMBRIAN TO EARLY CAMBRIAN

4

KELVIN GLEN FORMATION: orange arkosic sandstone; purple to grey wacke; micaeous red sandstone

FOURCHU GROUP (INCLUDING UNITS OF THE MAIN À DIEU SEQUENCE AND COASTAL AND STIRLING BELTS)

3

Volcanogenic Sediments: volcanic conglomerate, wacke, siltstone intercalated with volcanic flow and pyroclastic units

2

Intermediate to Felsic Volcanics: **2a**, dacitic to rhyolitic flows; **2b**, dacitic to rhyolitic tuff, quartz-feldspar crystal tuff; **2c**, undivided

1

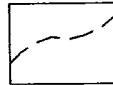

Mafic to Intermediate Volcanics: **1a**, basalt to andesite flows; **1b**, tuff, lapilli tuff, basalt to andesite lithic crystal tuff; **1c**, undivided

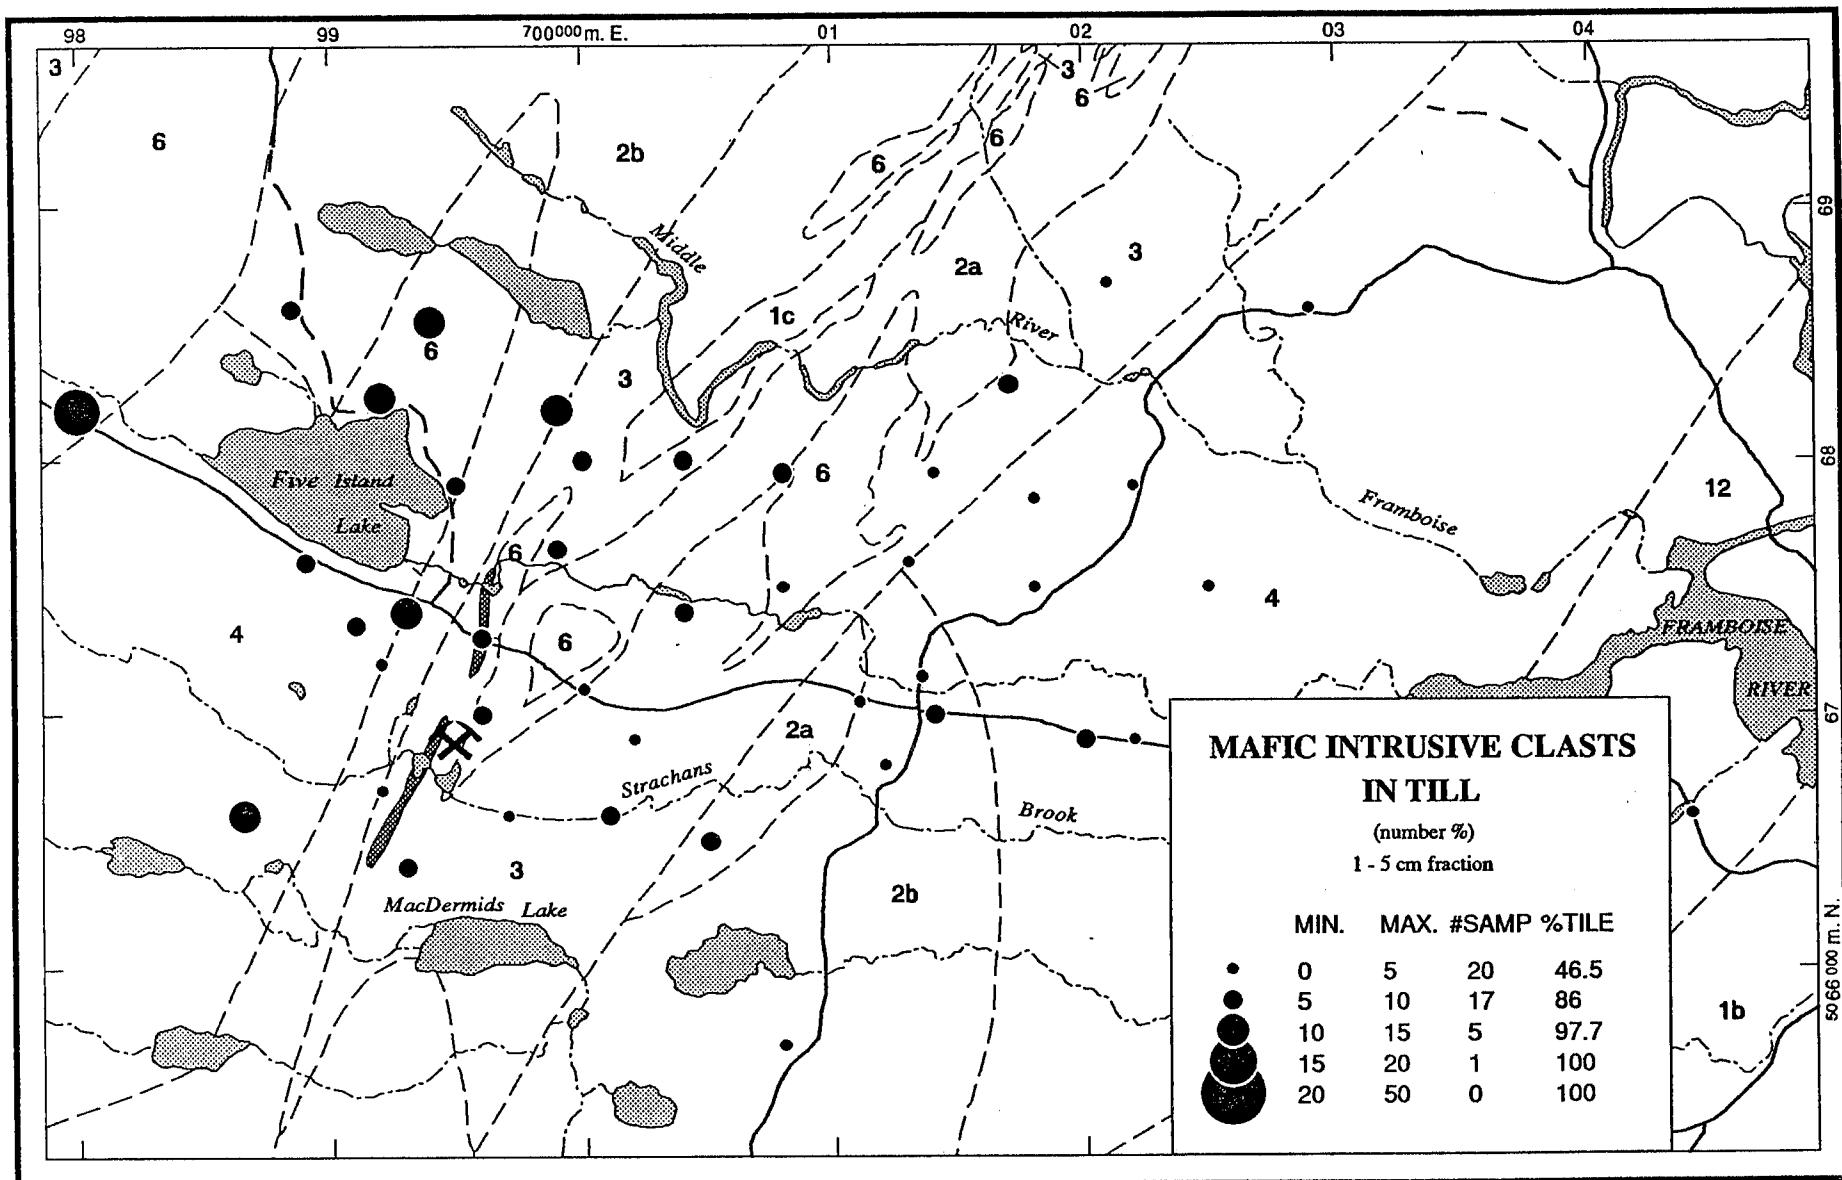

quartz-carbonate schist (alteration and/or chemical precipitates)

Mindamar Mine (Zn, Pb, Cu, Au, Ag)

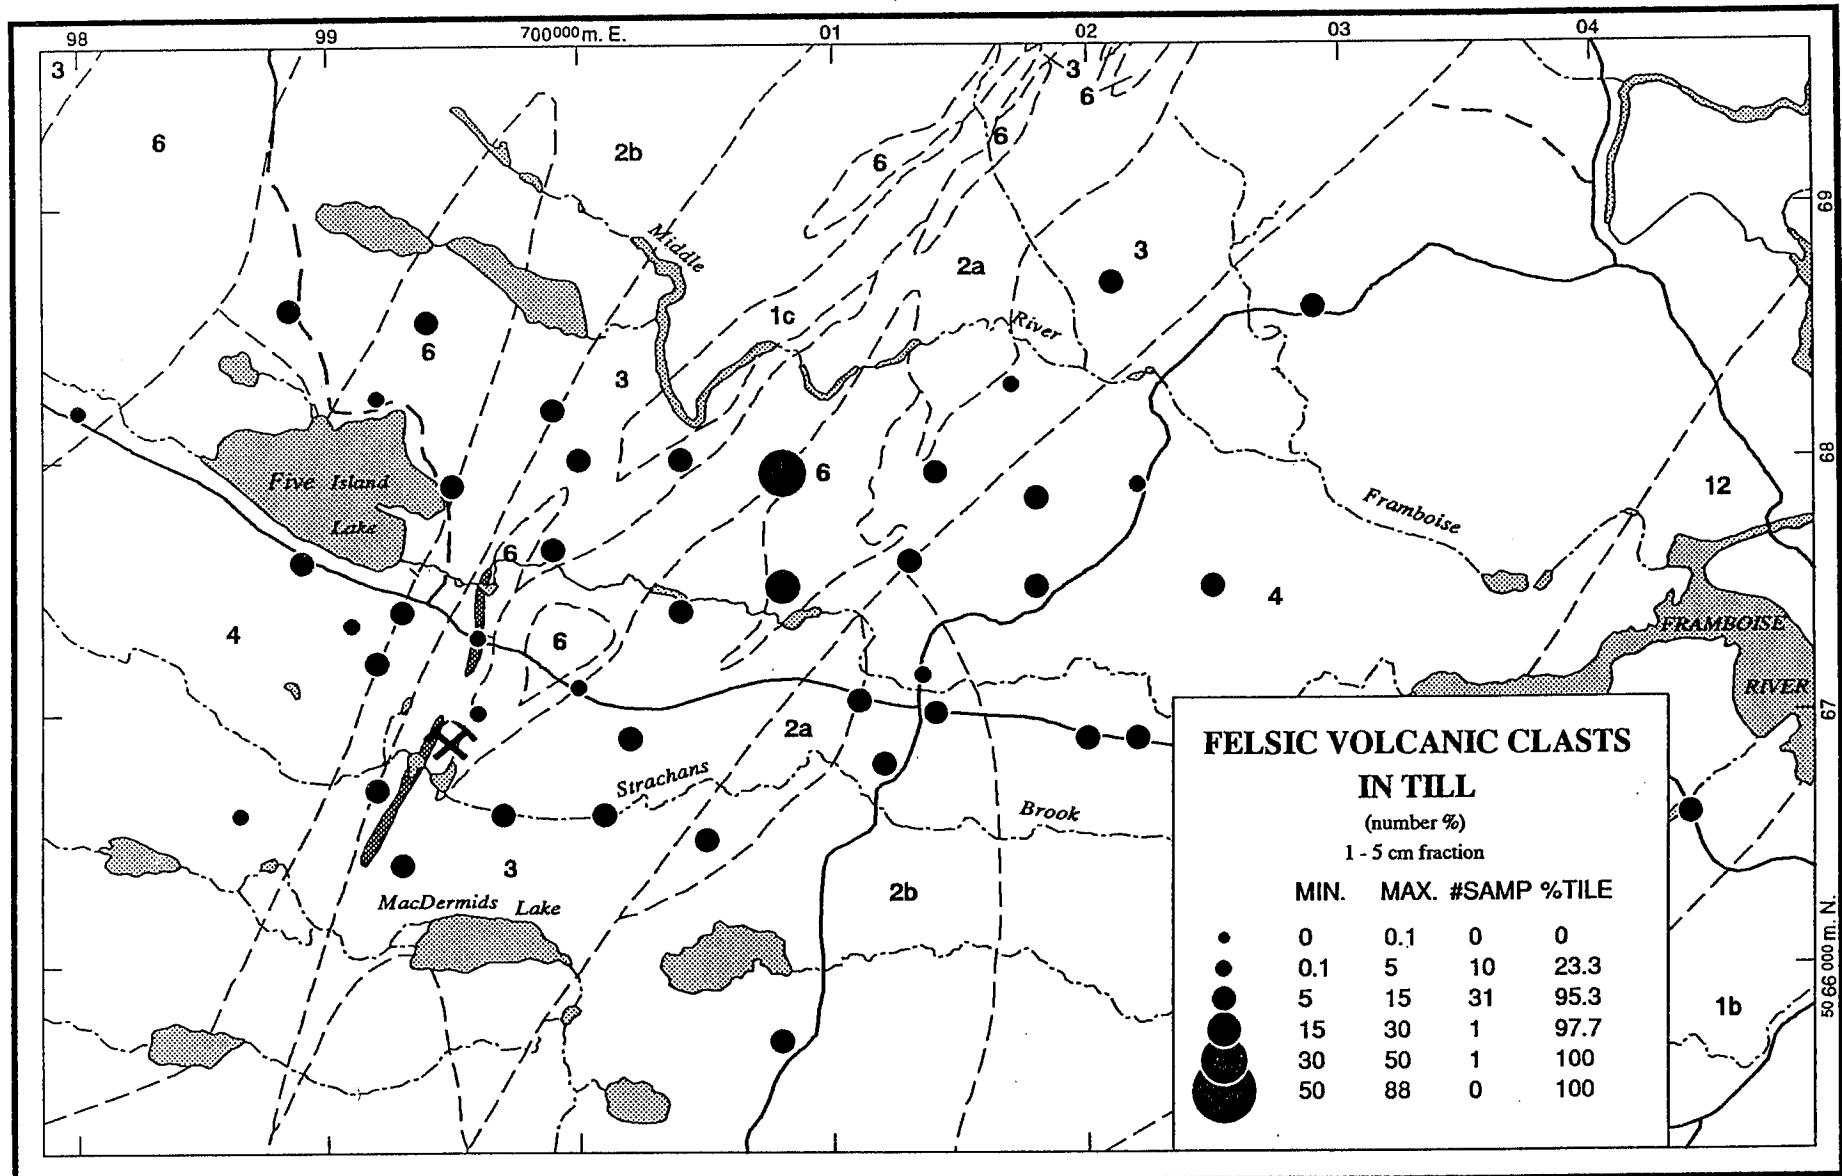

geological boundary
