**Reconnaissance Geochemical Data for Till Samples from the
Manitouwadge area, Ontario**

This Open File publication consists of two parts:

- 1) Summary Report including a 19 page manuscript summarizing interpretations of compositional data for till samples; a sample location map covering NTS map sheets 42F/04, 42C/13, 42F/05, 42E/01, 42E/08, 42F/06, and 42E/03; two clear film overlays of bedrock geology and hydrology; the following data bases (i) sample description and location; (ii) geochemical data; and (iii) pebble count data (Appendix A); statistical information for samples (Appendix B); and computer generated proportional symbol maps for selected Paleozoic and Precambrian lithologies in the 5.0-16 mm fraction and selected trace elements in the <63 μ m and <2 μ m fractions of till.
- 2) Sample description and location, geochemical, and pebble count data bases on 5 1/4 inch and 3 1/2 inch floppy disks (1.4 Meg format). Data are stored as tab delimited ascii (text) files.

INTRODUCTION

In 1991, the Geological Survey of Canada began a reconnaissance till sampling survey in the Manitouwadge area, Ontario (Fig. 1, 2). The program is part of the Northern Ontario Development Agreement (NODA) programme designed to aid and stimulate mineral exploration activities in the region. Two hundred and eighty-three till samples and 18 gravel samples were collected and analyzed for the content of trace and minor elements in the clay (<0.002 mm) and silt plus clay (<0.063 mm) fractions, and the relative proportion of various rock types of the pebble fraction (5.6-16.0 mm). An additional 375 samples, collected in 1992 in the above region and in the Hornepayne area, are currently being analyzed. Other aspects of the NODA project in the Manitouwadge area include Precambrian bedrock mapping (Zaleski and Peterson, 1993) and investigation of new and known mineral deposits (McKay, in prep.).

The Geological Survey of Canada had previously carried out a sampling survey of modern lake bottom sediments and lake waters around the north shore of Lake Superior, including the Manitouwadge area, in 1978 and 1979 (Geological Survey of Canada Open Files 506 and 555). Samples were reanalyzed in 1990 (Friske et al. 1991a, 1991b).

Location

The study area, located north of Lake Superior, covers approximately 4500 sq. km. and all or parts of the following 1:50,000 National Topographic System (NTS) map sheets - 42F/04, 42C/13, 42F/05, 42E/01, 42E/08, 42F/06, and 42E/03 (Fig. 1, 2, 3). The area sampled was accessed by a well-developed network of logging roads. The town of Manitouwadge is found in the centre of the region. It exists primarily as a service centre for the Geco Mine, a major producer of Cu, Zn, Au, and Ag - in the area.

Acknowledgments

The author wishes to thank the following: K. Laurus for her able assistance in the field and for carrying out pebble counts in 1991; D. B. McKay for helpful advice, the staff of the geology department of Noranda Geco mine for helpful discussions; S. Bauke for

assistance with data compilation; Northwood Geoscience for plotting the proportional symbol maps; D. Pare at Consorminex for carrying out pebble counts; P. Lindsay for co-ordinating the laboratory work carried out on the 1991 till samples; Tony Osmond for aiding with sample collection; and the staff of the Manitouwadge Motor Hotel for their generosity in providing me with sample storage facilities.

BEDROCK GEOLOGY

Most recent bedrock mapping at a regional scale was undertaken in the Manitouwadge area by Williams and Breaks (1990) and in the White Lake region by Siragusa (1985) and Milne (1968). Reports based on these and other studies have been used to compile a map of the geology of Ontario at a scale of 1:1 000 000 (Geological Survey of Canada, 1991), a simplified version of which is given in Figure 4. Figure 5 and Table 1 show the mineral occurrences in the area (D.B. McKay, in prep). The following, summary of the bedrock geology is based on these compilations and reports.

Most of the study area is underlain by Archean greenstone belts and granitoid plutons of the Wawa subprovince of the Canadian Shield (Williams et al., 1991). The Manitouwadge greenstone belt lies within a highly deformed remnant of supracrustal rocks near the boundary between the Quetico and Wawa subprovinces. It includes mafic and felsic volcanic and volcanioclastic rocks, metasomatically altered rocks, and iron formation. The Geco mine, a huge Cu-Zinc deposit, is located within the Manitouwadge greenstone belt (Fig. 1, Fig. 5). Part of the Schreiber-Hemlo greenstone belt underlies the southern part of the study region. This belt includes mafic metavolcanic rocks and intermediate to felsic metavolcanic units. South of the study area, the Schreiber-Hemlo greenstone belt is host to the Hemlo gold deposits.

The northern part of the study region is underlain by bedrock of the Quetico subprovince. It is composed primarily of metamorphosed wackes and siltstones with

minor amounts of iron formation, conglomerate and metasedimentary rocks of ultramafic composition (Williams, 1991).

GLACIAL GEOLOGY

Detailed mapping of surficial deposits was undertaken in the Manitouwadge and White Lake regions by Kristjansson and Geddes (1986) and Geddes and Bajc (1985). As part of this study, surficial deposits are being mapped in the adjoining Vein Lake area (42E/01) at a scale of 1:50 000. This is an extension of the mapping work undertaken by the Ontario Geological Survey. The summary presented below is based on the above surveys. Figure 6 is a generalized map of glacial geology of the region, adapted from Barnett et al. (1991).

All glacial deposits are thought to have been deposited during the Late Wisconsinan. Crosscutting relationships of striae indicate that the earliest ice flow direction was southerly while the latest ice flow was southwestwards. During this study, four striae directions (190° (oldest), $205\text{--}210^{\circ}$, 235° , and 245° (youngest)) were observed at one site east of the Pic River (Fig. 7). As the ice receded, the area was inundated by a glacial lake (post-Lake Minong) which occupied the Superior basin and followed the ice front as it retreated northward (Farrand and Drexler, 1985; Kristjansson and Geddes, 1986).

The most widespread glacial deposit is till. In most areas it forms a thin, discontinuous blanket up to 1.5 m thick, although in places it may exceed 10 m in thickness. Where deposits are thin, the till tends to be loose and sandy; where thick, it is generally massive and silty. Most till contains varying concentrations of Paleozoic carbonate debris indicative of glacial transport of over 100 km south-southwestward from the nearest outcrop in the Hudson Bay or James Bay lowland. Where till deposits are thick, concentrations of Paleozoic carbonate are generally high.

QUATERNARY RECENT

- 32** Organic deposits: peat, muck and marl
- 31** Fluvial deposits: gravel, sand, silt and clay; deposited on modern flood plains
- 30** Lacustrine deposits: sand, gravelly sand and gravel; nearshore and beach deposits
- 29** Lacustrine deposits: silt and clay; basin or quiet water deposits

PLEISTOCENE

- 28** Fluvial deposits: gravel, sand, silt and clay; deposited on abandoned flood plains, terrace remnants
- 27** Glaciomarine and marine deposits: sand, gravelly sand and gravel; nearshore and beach deposits
- 26** Glaciomarine and marine deposits: silt and clay; basin and quiet water deposits
- 25** Glaciolacustrine deposits: sand, gravelly sand and gravel; nearshore and beach deposits

24 Glaciolacustrine deposits: silt and clay, minor sand; basin and quiet water deposits

23 Glaciofluvial outwash deposits: gravel and sand; includes proglacial river and deltaic deposits

22 Glaciofluvial ice-contact deposits: gravel and sand; minor till; includes esker, kame, end moraine, ice-marginal delta and subaqueous fan deposits

21 Till: undifferentiated, fine grained, predominantly silty clay to silt matrix, commonly clast poor, high matrix carbonate content

18 Till: undifferentiated, predominantly sand to silty sand matrix, high content of clasts,

PRECAMBRIAN

- 1** Bedrock: undifferentiated igneous and metamorphic rock, exposed at surface or covered by a discontinuous, thin layer of drift

Figure 6. Glacial geology of the Manitouwadge area, after Barnett et al., 1991.

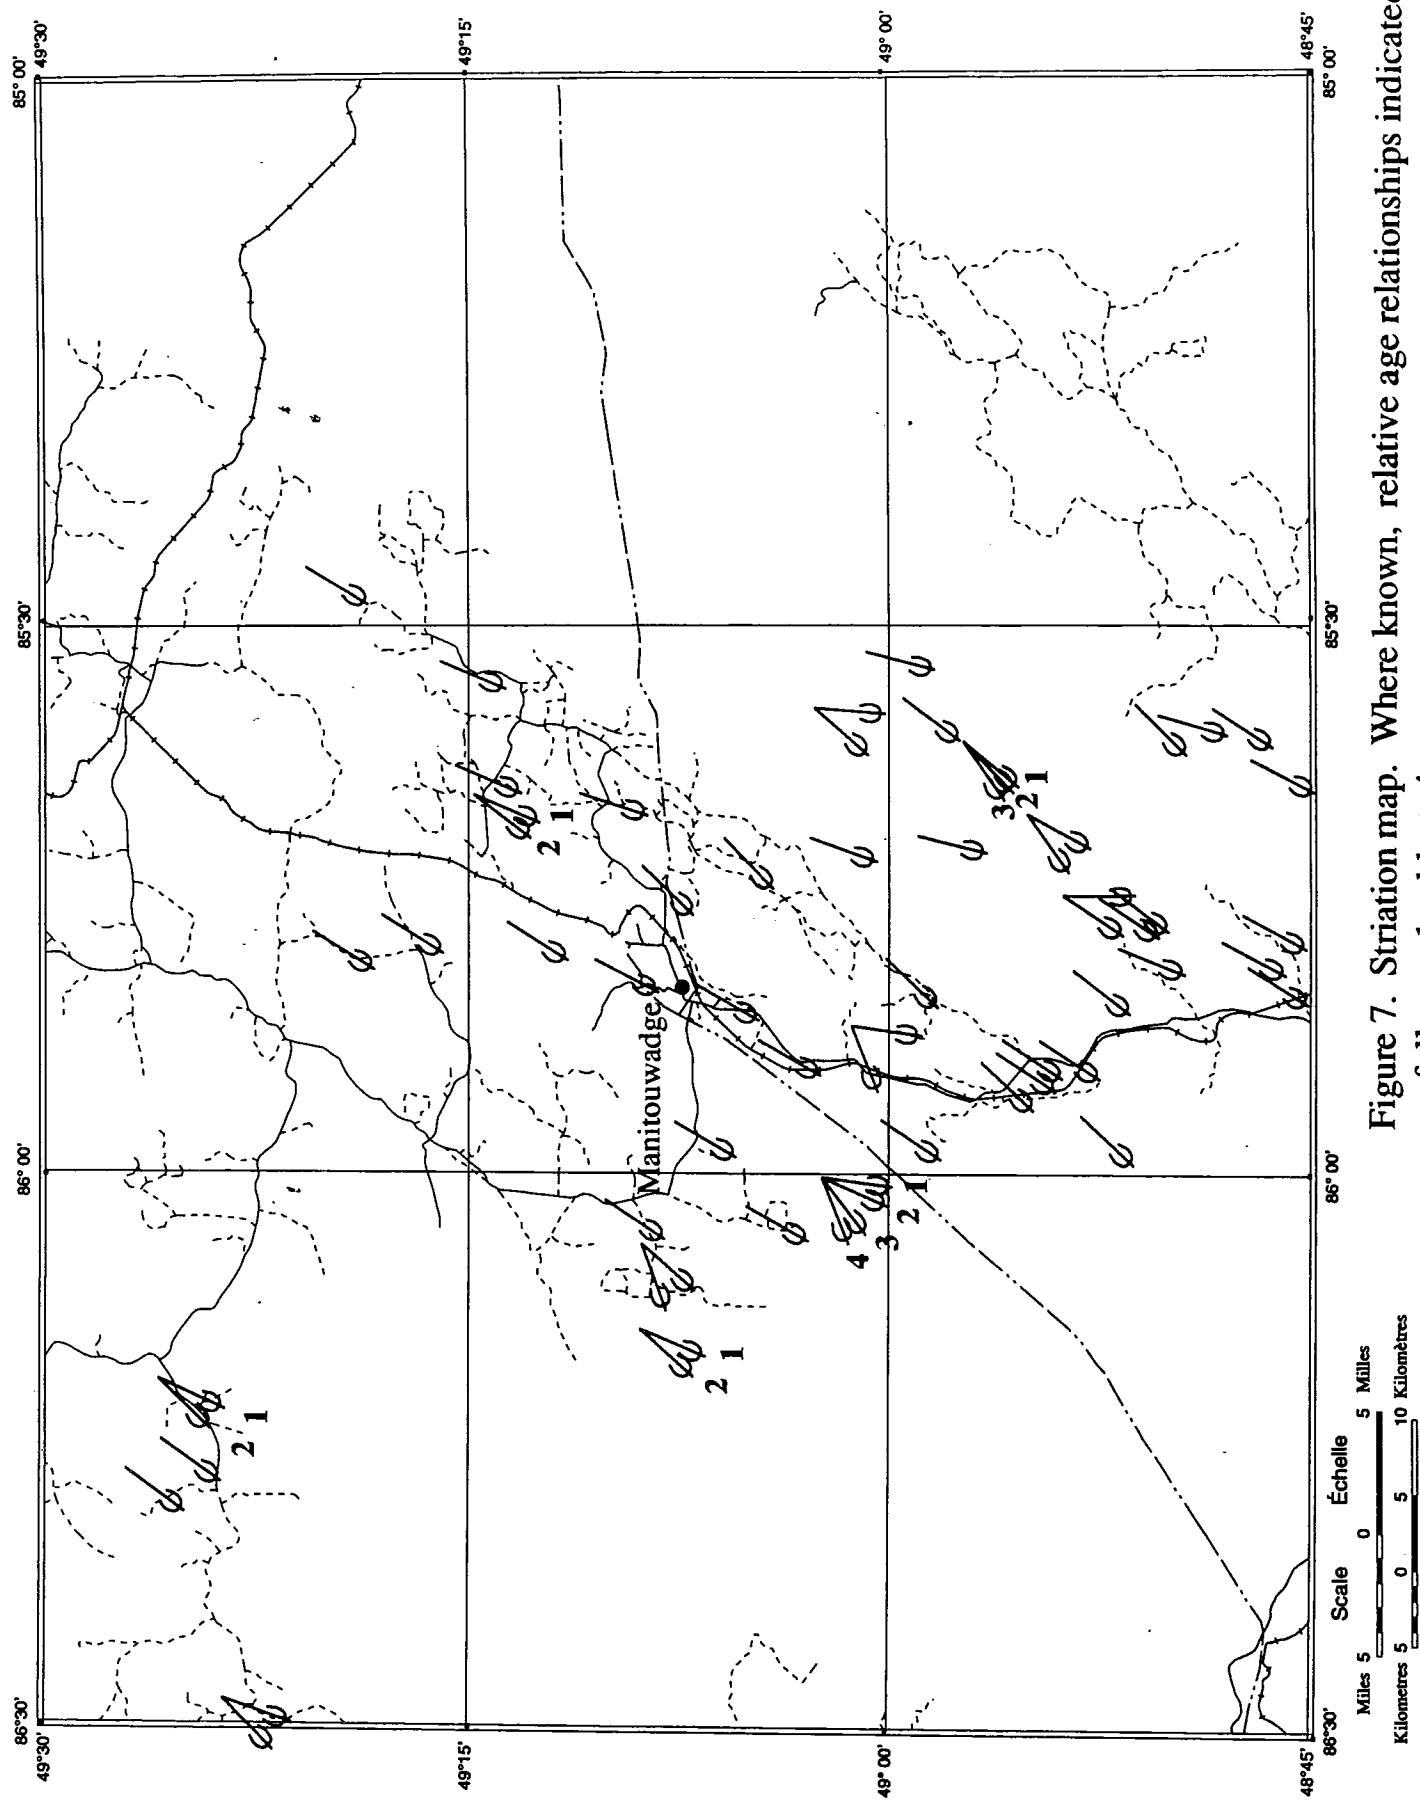

Figure 7. Striation map. Where known, relative age relationships indicated as follows: 1=oldest; 4=youngest.

Also common in the study area are glaciofluvial ice-contact and outwash deposits. These are composed of sand and gravel and take the form of eskers, kame terraces, and outwash plains. Outwash deposits are common in the region east of Manitouwadge in low lying areas above the maximum level of glacial lake incursion (Kristjansson and Geddes, 1986). In depressions below this level, glaciolacustrine deposits consisting of sand, silt, and clay are widespread. In the Manitouwadge area, these sediments may be found at elevations as high as 325 m a.s.l. (R. Geddes, 1987, unpublished report).

Aeolian deposits, composed predominantly of fine sand, are found at scattered locations. These deposits commonly take the form of dunes and occur in areas where outwash or glaciolacustrine sediments predominate. Alluvium, consisting of sand, silt and organic debris, is well developed along major rivers and streams. Deposits of peat and organic muck are also common, particularly in areas underlain by fine-grained glaciolacustrine sediments.

FIELD AND LABORATORY METHODS

Till samples were collected from hand-dug holes, usually one or more metres deep, along or adjacent to roads and trails crossing the area. Care was taken to sample till that was as unweathered as possible, with samples being collected below the level of the modern solum. In the best exposures, multiple samples were collected in profile through both weathered and unweathered materials.

Pebbles (5.0-16.0 mm) were separated from most samples for lithological analysis. On average, 230 clasts were examined from each sample ; the clasts were grouped into the following 6 classes and relative percentages calculated: 1) Paleozoic limestones and dolomites; (2) Paleozoic sandstones and siltstones; 3) Proterozoic greywackes and argillites (these clasts are characteristic of the Omarolluk Formation which outcrops in the Belcher Island Fold Belt and Sutton Inlier, described, for example, by Ricketts and Donaldson, 1981; 4) Precambrian metasediments of uncertain provenance; 5)

Precambrian intrusive and high grade metamorphic, i.e. coarsely crystalline, clasts; and
6) Precambrian metavolcanic rock, undifferentiated.

The silt plus clay (<0.063 mm) fraction was obtained by dry sieving, and the clay (<0.002 mm) fraction by dry sieving and centrifugation. The two fractions were analyzed at Bondar-Clegg Ltd. for the following 28 trace and minor elements - Ag, Al, As, Ba, Bi, Ca, Cd, Co, Cr, Cu, Fe, Hg, K, La, Mg, Mn, Mo, Na, Ni, Pb, Sb, Sc, Sr, Sn, Te, V, W, Y, A and Zn - by Inductively Coupled Plasma and Atomic Emission Spectroscopy (ICP-AES) after use of a nitric acid-aqua regia partial extraction. The <0.063 mm fraction was further analyzed for Au, Pt, and Pd by fire assay and Direct Current Plasma (DCP) spectroscopy.

DRIFT COMPOSITION

Sample locations, description, geochemical and pebble lithology data for more than 275 till and 18 gravel samples and geochemical data for 35 duplicate till and standard samples are listed and explained in Appendix A. For a number of elements, notably molybdenum and cadmium, reproducibility of analytical data was only fair. (See data lists and scattergrams for blind duplicate till samples in Appendices A and B (ii), respectively.) As a result, these data should be used with some caution.

Statistical information has been generated for representative samples from all sites (Appendix B (i)) using the Statview software program for Macintosh computers. Appendix B also contains scattergrams showing results of first run trace element data versus second run data for blind duplicate samples, and a correlation matrix for trace element and pebble lithology data for all representative samples.

Maps showing the following regional distribution patterns in till: (1) selected trace elements in the <0.002 mm fraction; (2) selected trace elements in <0.063 mm fraction; and (3) Paleozoic sedimentary and selected Precambrian lithologies in the 5.6-16.0 mm fraction, are found in Appendix C. Frequency histograms and normal probability curves for geochemical and pebble count data are also included. Clear

plastic overlays of hydrology (Fig. 3) and bedrock geology (Fig. 4) are included to aid with interpretation and location of results. The bedrock geology shown in Figure 4 is based on a recent regional compilation (Ontario Geological Survey, 1991) while the bedrock types listed for samples in Appendix A(i) were obtained using detailed maps (Williams and Breaks, 1990; Milne, 1968).

The frequency distribution and dispersal patterns of pebbles in till samples from the Manitouwadge area was studied to gain knowledge of the relationships of glacial flow to variations in composition (Appendix C). Two major bedrock terranes are represented by clasts in the tills of this region: 1) local Precambrian units and 2) Paleozoic and Proterozoic terranes of the Hudson Bay and James Bay Lowlands. Clasts derived from the Paleozoic and Proterozoic terranes were glacially transported at least 100 km and may significantly dilute the local debris.

The pebble fraction of more than 95% of the 285 till samples collected contained at least 5% Paleozoic carbonate. The frequency histogram for Paleozoic carbonate clasts (Appendix C) shows that Paleozoic clast frequencies are distinctly bimodal, falling into two broad groups, those with less than 35% Paleozoic carbonate and those with more. In addition, over 60% of the samples contained more than 10% clasts of Proterozoic metasedimentary rock. In contrast, highest concentrations of local Archean bedrock lithologies were found in till overlying or close to their outcrop areas.

Where there are high concentrations of Paleozoic carbonate in till, the geochemical signature of the fine fraction of till tends to be suppressed (See correlation matrix, Appendix B(iii); Kaszycki, 1989). Unmetamorphosed carbonate bedrock is known to have low trace element concentrations (Mason, 1962, Table 6.5).

Despite the effects of dilution from exotic debris, the distribution patterns of trace and minor elements in drift may be related in many cases to bedrock composition. High elemental concentrations in till in some areas may reflect high background levels in

bedrock. For example, background levels of platinum in till are higher in Quetico terrane than in Wawa terrane.

In other areas, high trace element levels in drift may reflect mineralized occurrences in the underlying or nearby bedrock. In Wawa terrane, highest levels of copper, zinc, lead, silver, gold, palladium, cadmium, and arsenic are found in samples collected from till overlying the mafic to intermediate rocks of the Manitouwadge greenstone belt, particularly in the vicinity of the Geco and Willroy copper-zinc deposits, and, also, overlying the Hemlo-Schrieber greenstone belt west of White Lake. Elsewhere, there are high levels of gold in till in the Fourbay Creek area. High concentrations of cobalt, chromium, nickel, and vanadium in till are found here and there in the study area associated with a number of different rock types. Till is especially enriched in nickel and also in cobalt and chromium in the Swill Lake area and in chromium near the Geco mine.

Another major factor which influences the geochemical signature of surface till in any region is surface weathering. In this study, the effects of weathering on composition have been minimized by sampling till below the postglacial solum. As a result, regional patterns of trace element and Paleozoic and Precambrian clasts or trace elements in drift are not significantly altered by compositional variation caused by weathering.

CONCLUSIONS

Results of the sampling survey show that variations in till composition may, in many cases, be related to both the effects of glacial transport and the composition of underlying or nearby bedrock. In many areas, the till contains a large component of debris derived from Paleozoic sedimentary bedrock and glacially transported more than 100 km from the Hudson and James Bay lowland. Where present in large quantities, this exotic material tends to suppress the geochemical signature of the fine fraction of till.

Despite the effects of dilution by exotic debris, the signature of mineralized bedrock does stand out in till in many cases. As would be expected, very high concentrations of copper, zinc, and other elements are found in till overlying and down ice from the Geco and other now abandoned mines in the Manitouwadge area. Elsewhere, as shown on the trace element distribution maps, there are high levels of copper, zinc, and other elements in till in some areas underlain by bedrock of the Manitouwadge and Schreiber-Hemlo greenstone belts. Follow-up mineral exploration work in these areas may prove worthwhile. High levels of gold were found in till in the Fourbay Creek area. Additional till samples, collected in this region in 1992, are presently undergoing analysis.

High levels of trace elements in till may also reflect high background levels of trace elements in the underlying bedrock. For example, background levels of base metals are generally high in till overlying greenstone terrane. Also results of this study show that platinum levels are generally elevated in Quetico terrane compared to Wawa terrane.

ROCK TYPE KEY

Milne (1968)

Archean late silicic plutonic rocks

- 7 undifferentiated
- 7a biotite leucogranodiorite
- 6a hornblende-biotite granodiorite and quartz monzonite

Archean early silicic plutonic rocks

- 5 undifferentiated

Archean metasediments

- 3a conglomerate and greywacke
- 3c biotite-quartz feldspar paragneiss

Archean intermediate to silicic metavolcanics, pyroclastic rocks, and metasediments

- 2g agglomerate, tuff, greywacke

Archean mafic to intermediate metavolcanics

- 1a medium- to fine-grained, massive and gneissic amphibolite
- 1b medium- to coarse-grained, massive and gneissic amphibolite
- 1d pillow lava

William and Breaks (1990)

Proterozoic mafic intrusive rocks

- 7 undifferentiated
- 7a diabase dykes, non-porphyritic

Archean granodioritic to granitic rocks

- 6 undifferentiated
- 6a undeformed and deformed granitoid masses associated with the tonalite-granodiorite suite

Archean tonalitic to granodioritic rocks

- 5 undifferentiated
- 5a massive to foliated, biotite-bearing
- 5b foliated to gneissic, biotite-bearing
- 5c massive to foliated, hornblende, biotite-bearing
- 5d foliated to gneissic, hornblende, biotite-bearing
- 5e massive to foliated, or gneissic, rich in mafic metavolcanic incusions and screens
- 5g meladiorite, diorite phases
- 5j syn-plutonic mafic sheets, foliated to massive, often net-veined

Archean mafic, ultramafic and anorthositic rocks

- 4 undifferentiated
- 4a gabbro, derived gneiss, agmatite
- 4b leucogabbro, anorthositic gabbro, anorthosite and derived gneisses
- 4d mafic inclusions of unknown origin within tonalite-granodiorite suite

Archean metasedimentary rocks

- 3 undifferentiated
- 3a graded or ungraded feldspathic arenite, pelite, psammite paragneiss and associated migmatite
- 3b ironstone, layered quartz-magnetite rock
- 3d metasedimentary rocks containing orthopyroxene (granulite facies indicator)

Archean intermediate to felsic metavolcanic rocks

- 2 undifferentiated

Archean mafic to intermediate metavolcanic rocks

- 1 undifferentiated
- 1a medium- to fine-grained, massive, foliated amphibolite
- 1b coarse- to medium-grained, massive, foliated amphibolite

**A (ii) Trace and Minor Element Data for Clay (< 2 µm) Fraction
of Till and Gravel Samples**

Explanation

Sample No. Sample number
 Sed. Type Sediment type of sample
 Plot 1 - sample representative of sediment at site
 0 - sample less representative of sediment at site
 Zone UTM grid zone
 Easting (m) UTM easting (metres)
 Northing (m) UTM northing (metres)
 Lat. (deg) Latitude (degrees)
 Long. (deg) Longitude (degrees)
 NTS Map National Topographic System 1:50 000 map sheet

| Element | Unit of Measure | Detection Limit | Analytical Method |
|---------|-----------------|-----------------|--|
| Al | Aluminium | pct | 0.01% HCl-HNO ₃ , (3:1) ICP |
| Fe | Iron | pct | 0.01% HCl-HNO ₃ , (3:1) ICP |
| Mn | Manganese | ppm | 1 ppm HCl-HNO ₃ , (3:1) ICP |

**A (iii) Trace and Minor Element Data for Silt plus Clay (< 63 µm) Fraction
of Till and Gravel Samples**

Explanation

| | |
|--------------|---|
| Sample No. | Sample number |
| Sed. Type | Sediment type of sample |
| Plot | 1 - sample representative of sediment at site 0 - sample less representative of sediment at site |
| Zone | UTM grid zone |
| Easting (m) | UTM easting (metres) |
| Northing (m) | UTM northing (metres) |
| Lat. (deg) | Latitude (degrees) |
| Long. (deg) | Longitude (degrees) |
| NTS Map | National Topographic System 1:50 000 map sheet |

| Element | Unit of Measure | Detection Limit | Analytical Method |
|---------|-----------------|-----------------|-------------------|
| Al | Aluminium | pct | 0.05% |
| Fe | Iron | pct | 0.01% |
| Mn | Manganese | ppm | 50 ppm |
| Mg | Magnesium | pct | 0.05% |
| Ca | Calcium | pct | 0.01% |
| Na | Sodium | pct | 0.05% |
| K | Potassium | pct | 0.05% |
| Sc | Scandium | ppm | 5 ppm |
| V | Vanadium | ppm | 1 ppm |
| Cr | Chromium | ppm | 1 ppm |
| Co | Cobalt | ppm | 1 ppm |
| Ni | Nickel | ppm | 1 ppm |
| Cu | Copper | ppm | 1 ppm |
| Zn | Zinc | ppm | 1 ppm |
| As | Arsenic | ppm | 5 ppm |
| Sr | Strontium | ppm | 1 ppm |
| Y | Yttrium | ppm | 1 ppm |
| Mo | Molybdenum | ppm | 1 ppm |
| Ag | Silver | ppm | 0.2 ppm |
| Cd | Cadmium | ppm | 1 ppm |
| Sn | Tin | ppm | 20 ppm |
| Sb | Antimony | ppm | 5 ppm |
| Te | Tellurium | ppm | 10 ppm |
| Ba | Barium | ppm | 1 ppm |
| La | Lanthanum | ppm | 1 ppm |
| W | Tungsten | ppm | 20 ppm |
| Pb | Lead | ppm | 2 ppm |
| Bi | Bismuth | ppm | 5 ppm |
| Pd | Palladium | ppb | 1 ppm |
| Pt | Platinum | ppb | 3 ppm |
| Au | Gold | ppb | 1 ppm |

| Sample No. | Sed. Type | Plot Zone | Grid m | Eastng m | Northng m | Latitude deg | Longitude deg | Al pct | Fe pct | Mn ppm | Mg pct | Ca pct | Na pct | K pct |

A (iv)**Trace and Minor Element Data for Clay (< 2 μm) and
Silt plus Clay (<63 μm) Fractions of Duplicate Till Samples**

For explanation of data, see Appendix A (ii) and A (iii).

SBA and TCA are Terrain Sciences standards

Manitouwadge 1991 Trace Element Data - duplicates and standards for < 2 µm fraction

A (v) Pebble Lithology Data for the 5.6-16.0 mm Fraction
of Till and Gravel Samples

| <i>Explanation</i> | |
|--------------------|---|
| Pz carb % | Per cent Paleozoic carbonate clasts |
| Pz ss % | Per cent Paleozoic sandstone clasts |
| Prot % | Per cent Proterozoic metasedimentary clasts |
| Gran % | Per cent Precambrian granitic clasts |
| Msed % | Per cent Other Precambrian metasedimentary clasts |
| Mvol % | Per cent Precambrian metavolcanic clasts |

APPENDIX B

- B (i) Summary Statistics for Geochemical and Pebble Count Data for Representative Till and Gravel Samples
- B (ii) Scattergrams of First Run and Blind Duplicate Analytical Data for Till Samples
- B (iii) Correlation Matrix for Geochemical and Pebble Count Data for Representative Till and Gravel Samples

B (i)**Summary statistics for geochemical and pebble count data
for representative till and gravel samples***Explanation*

| | |
|-------------|--|
| Pz carb % | Per cent Paleozoic carbonate clasts |
| Pz ss % | Per cent Paleozoic sandstone clasts |
| Prot % | Per cent Proterozoic metasedimentary clasts |
| Gran % | Per cent Precambrian granitic clasts |
| Msed % | Per cent Other Precambrian metasedimentary clasts |
| Mvol % | Per cent Precambrian metavolcanic clasts |
| Std. Dev. | Standard deviation |
| Std. Error | Standard error |
| Coef. Var. | Coefficient of variance |
| Sum of Sqr. | Sum of squares |
| # <10th % | Number of samples with data values less than the 10th percen |

Cobalt in the <0.002 mm fraction of till

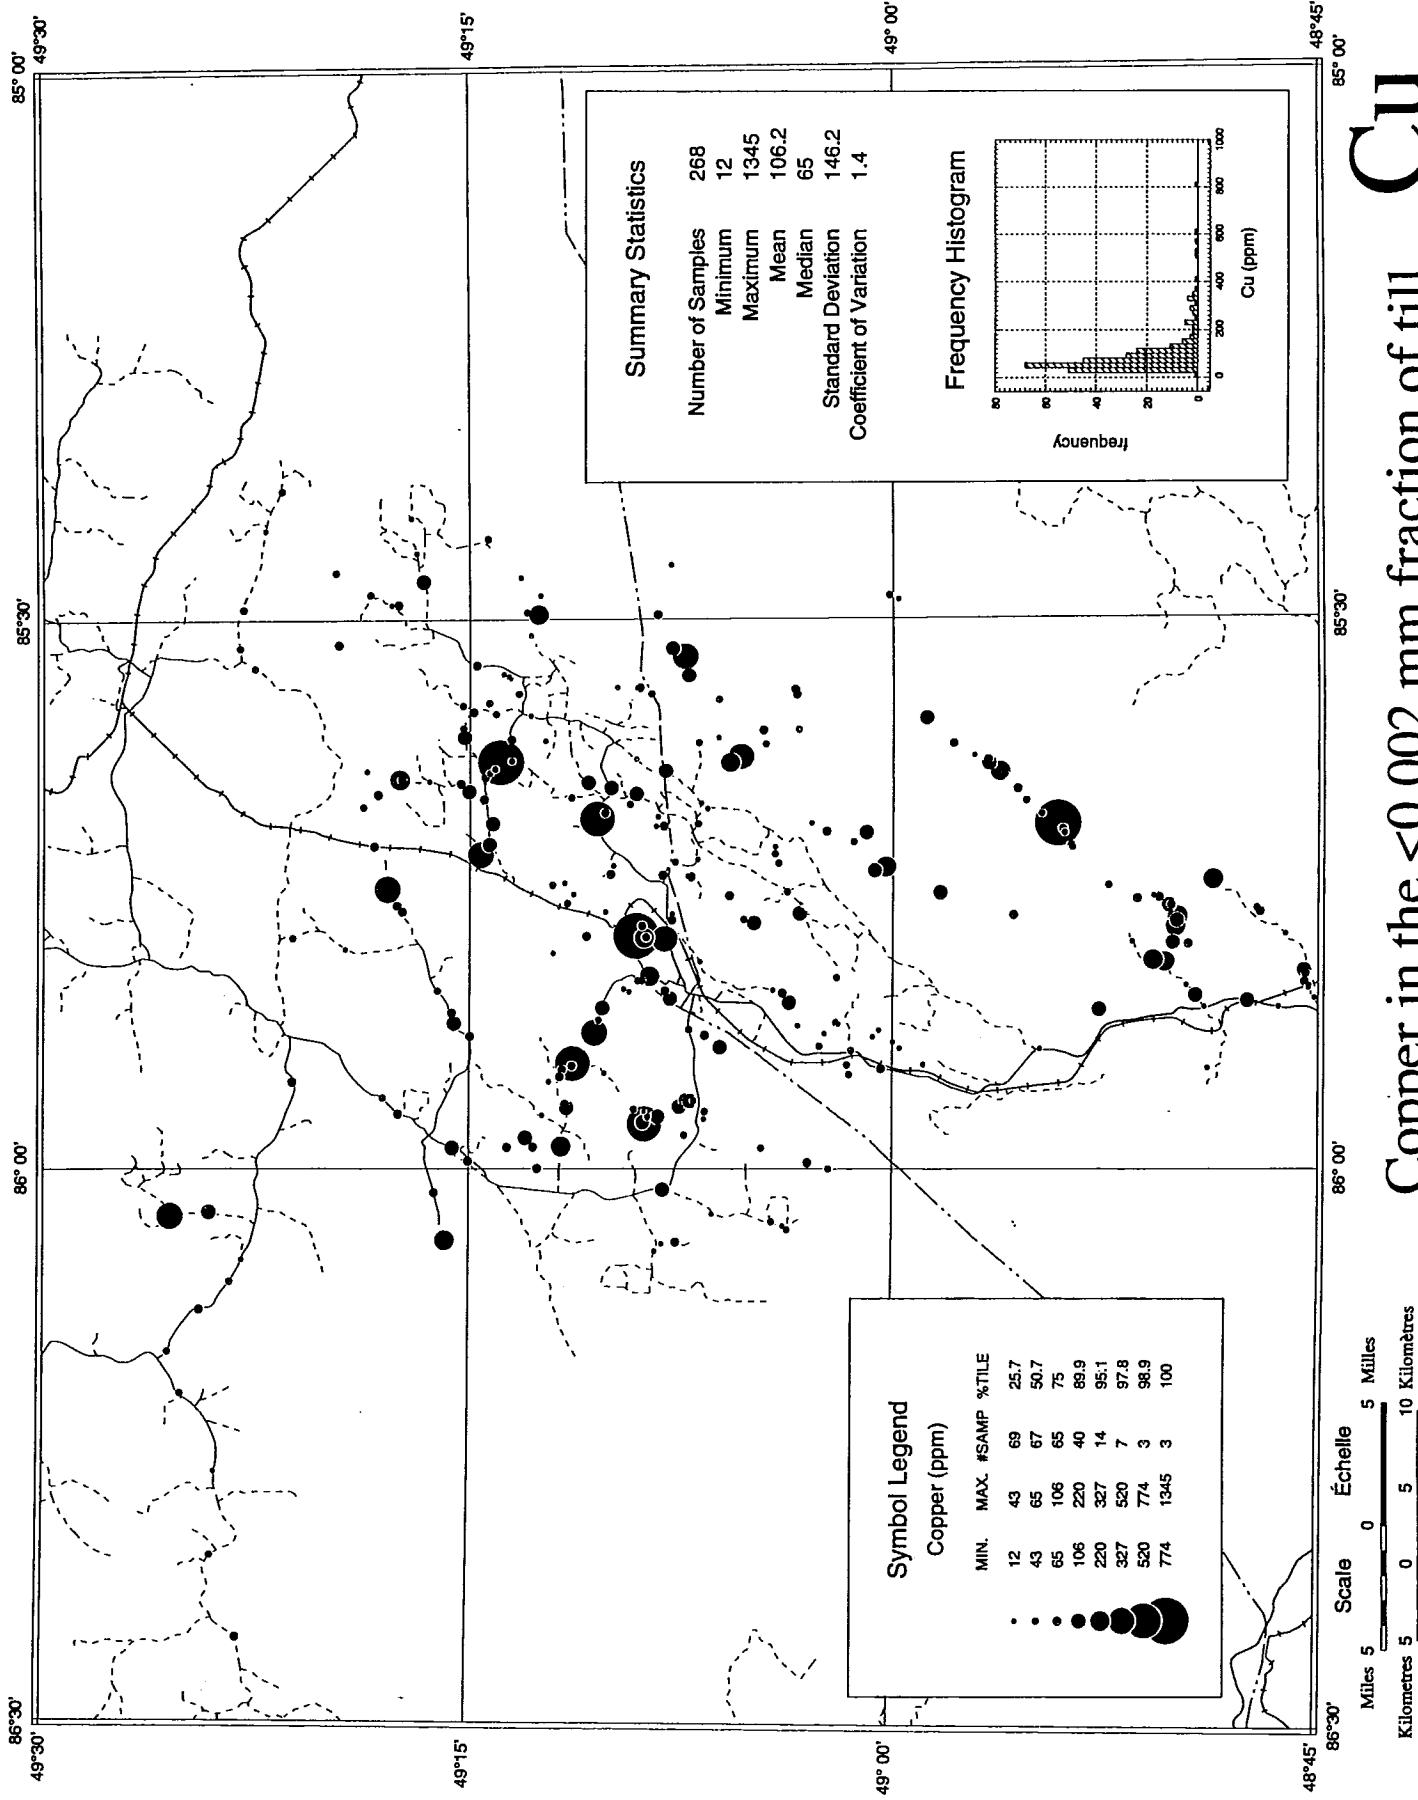

Cr

Chromium in the <0.002 mm fraction of till

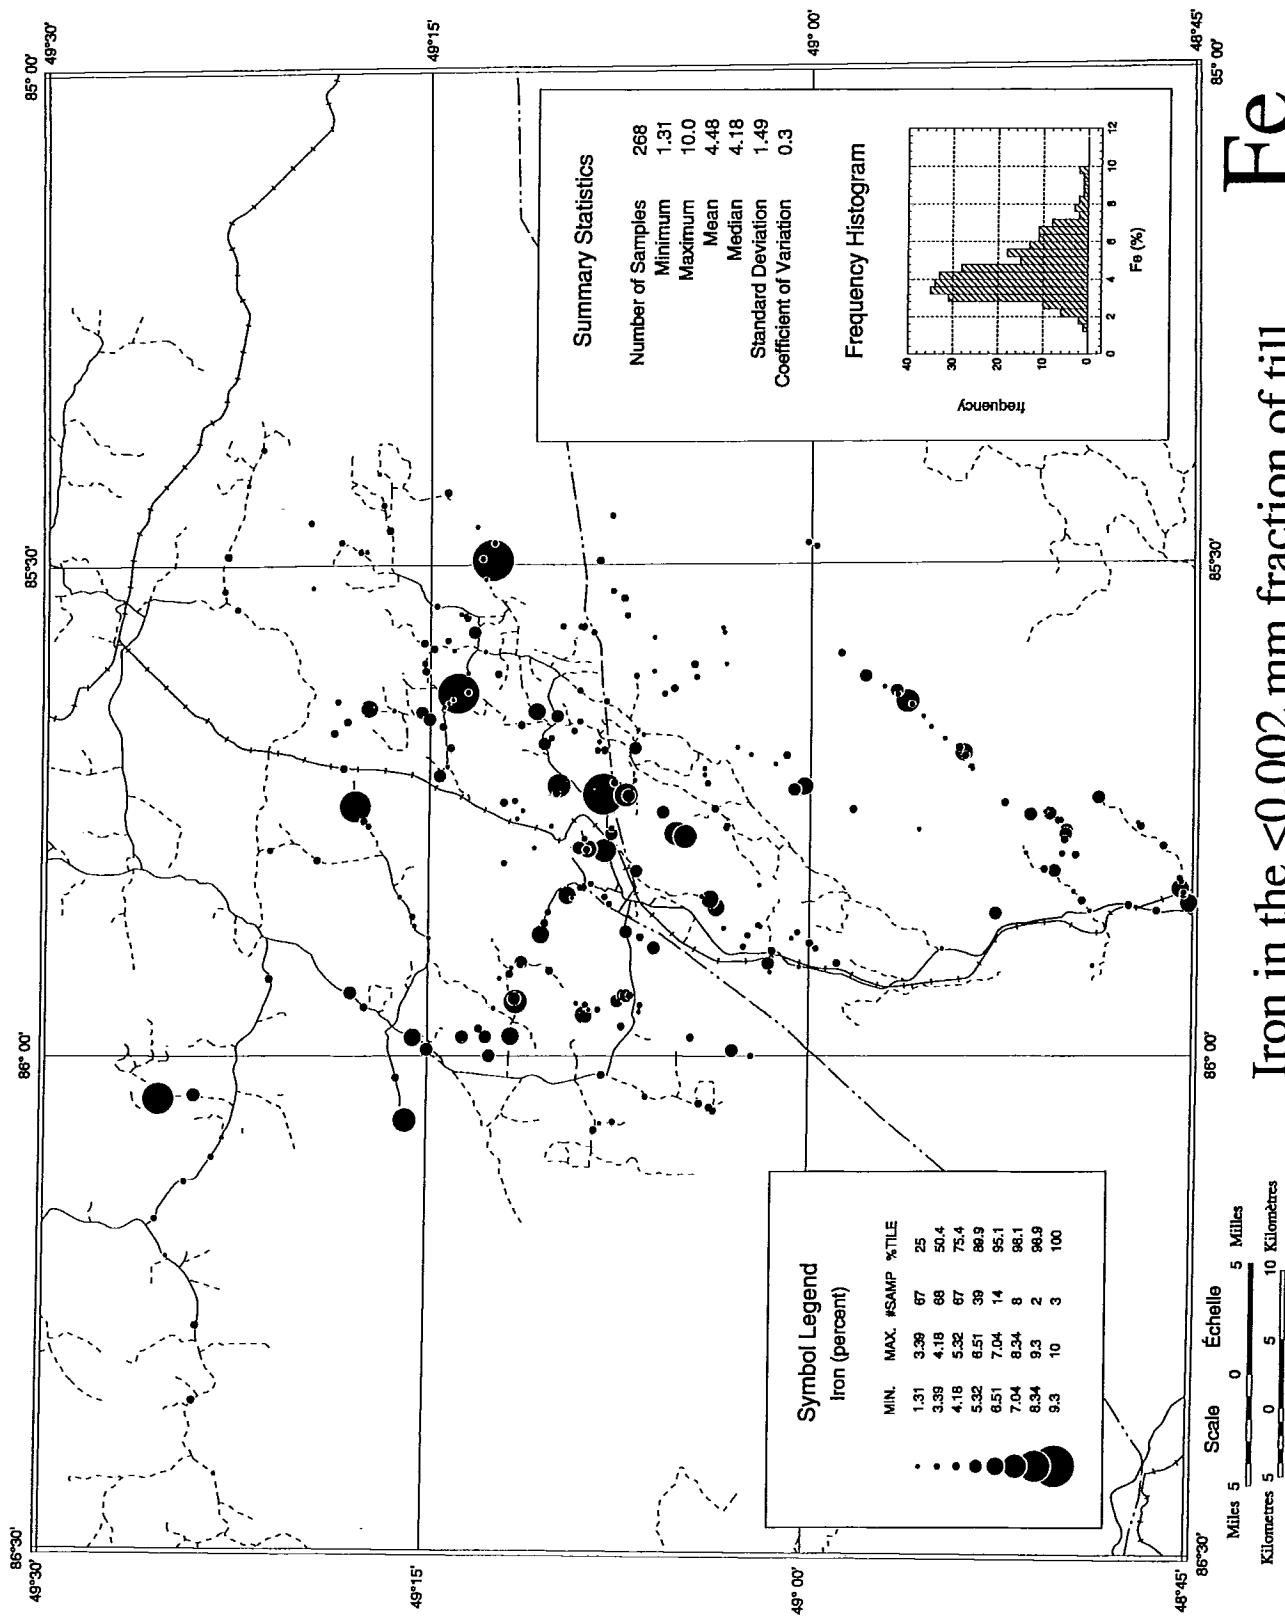

Cu

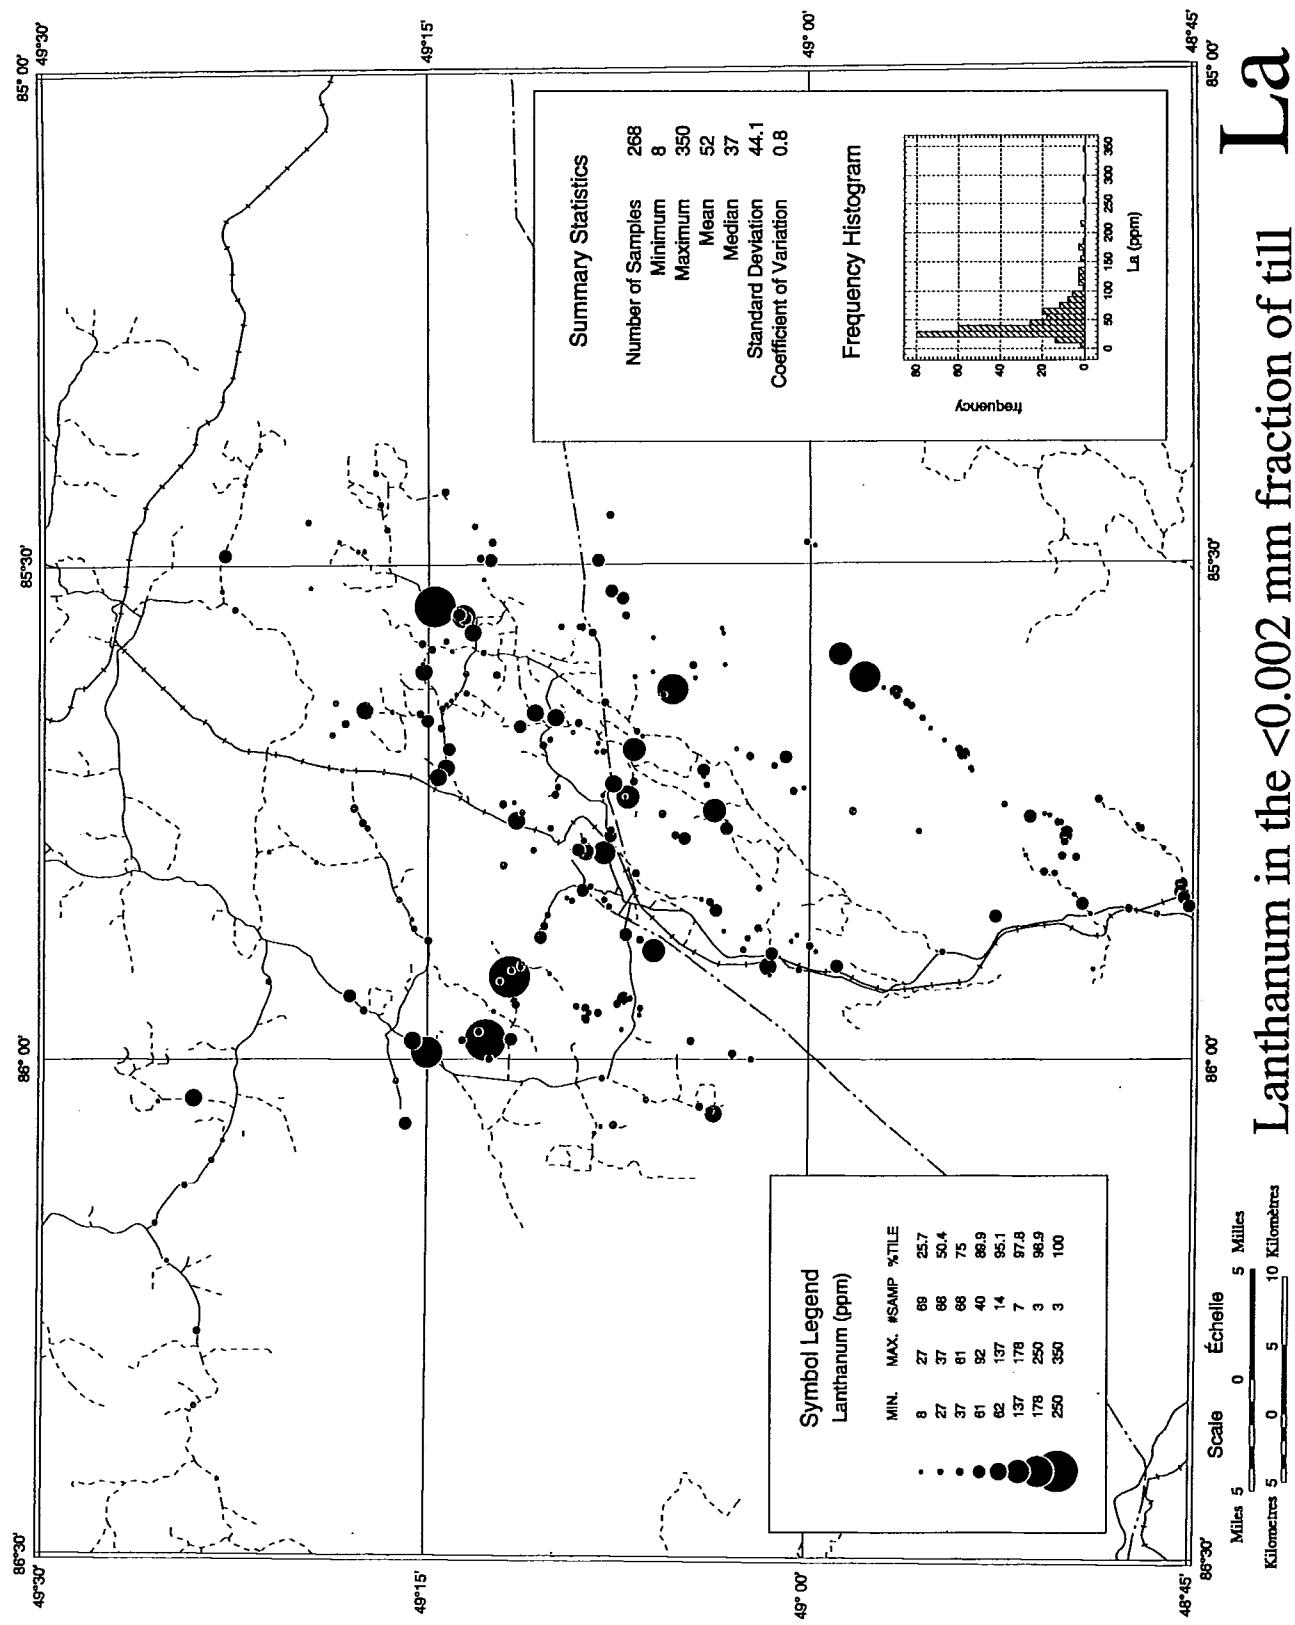

Copper in the <0.002 mm fraction of till

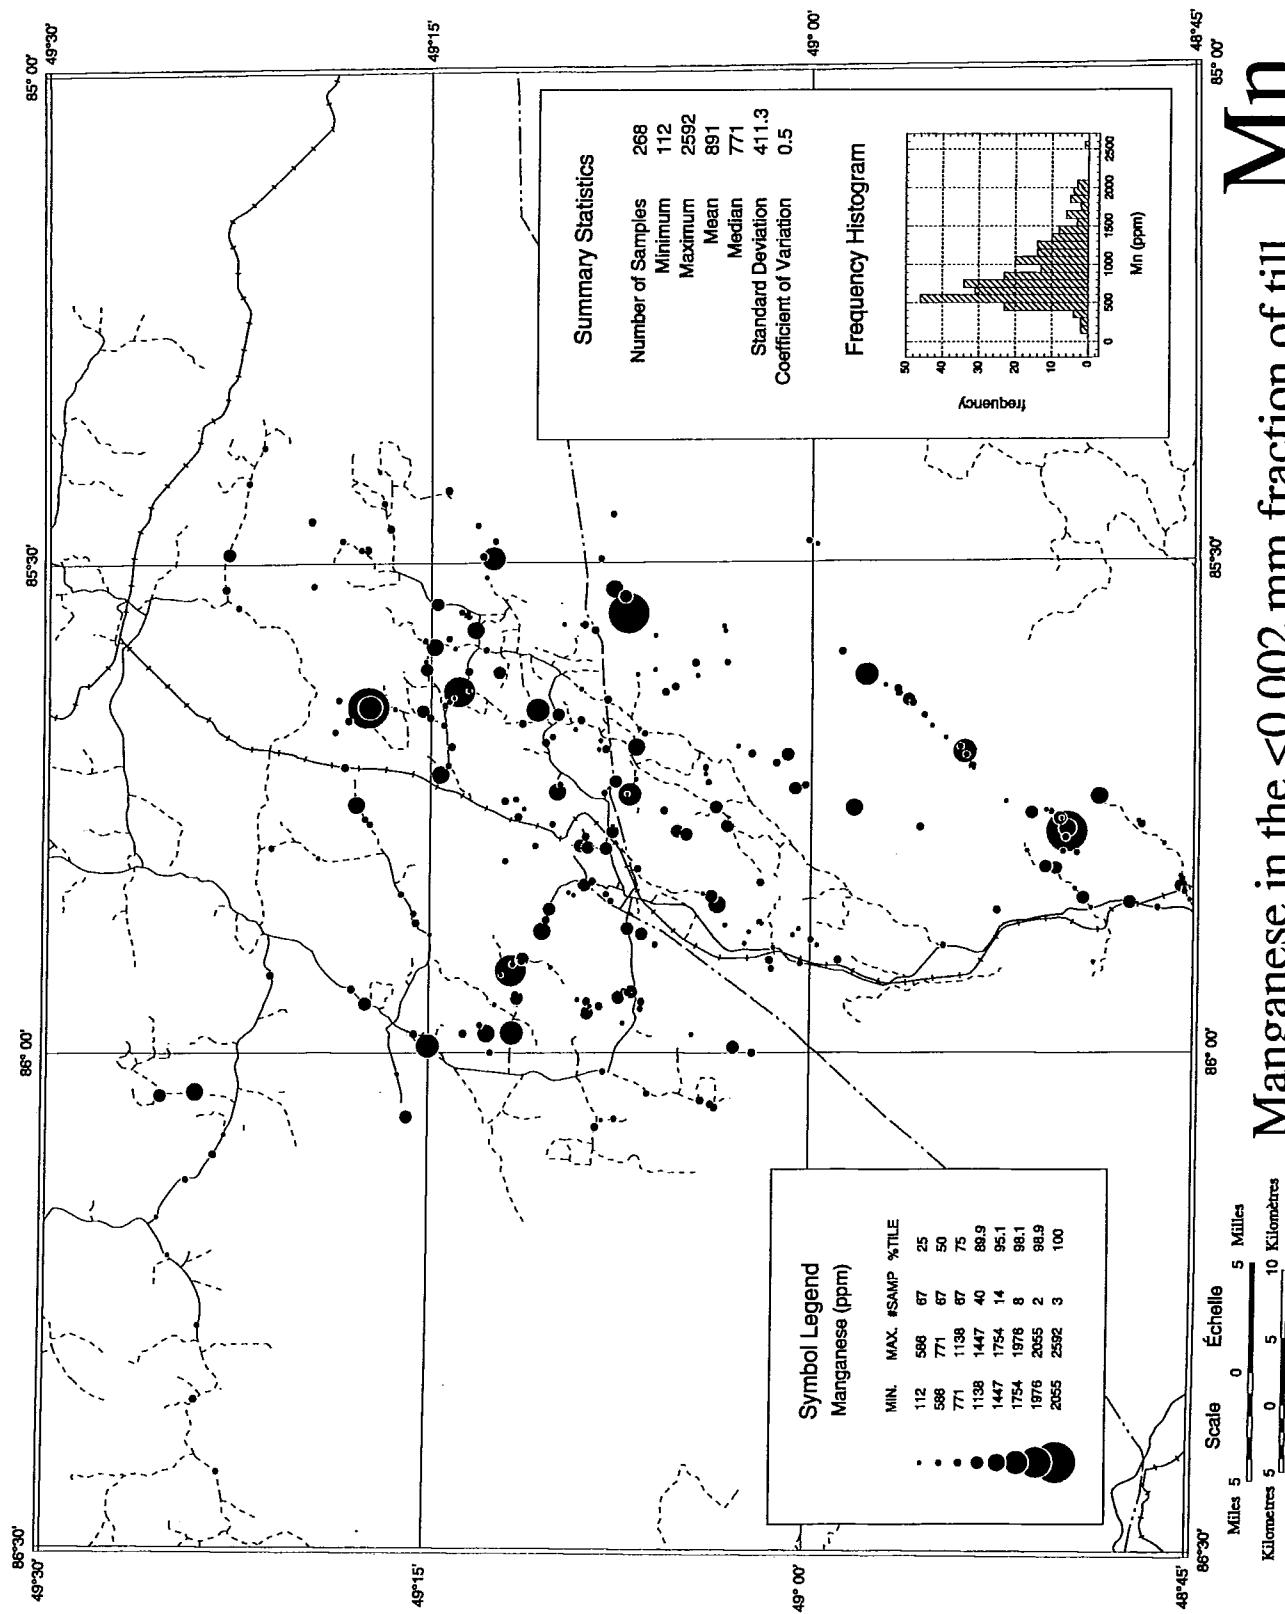

Fe

Iron in the <0.002 mm fraction of till

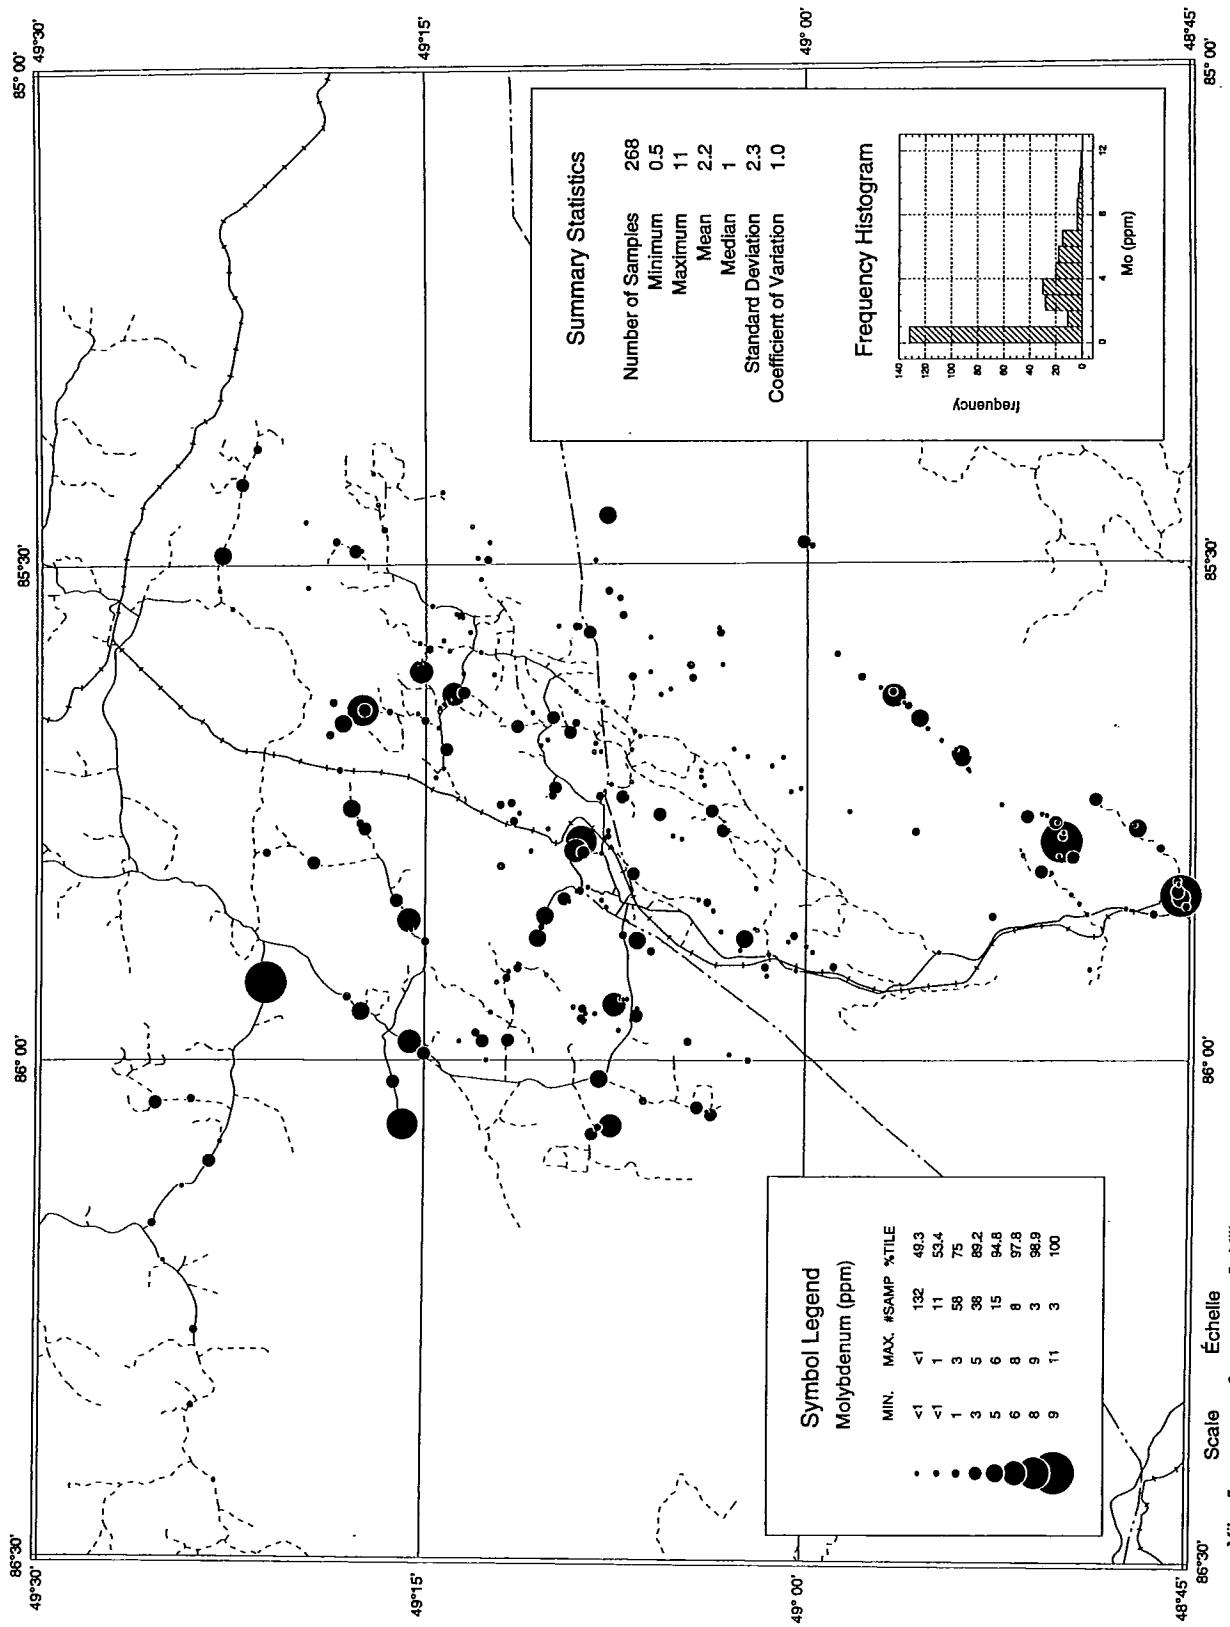

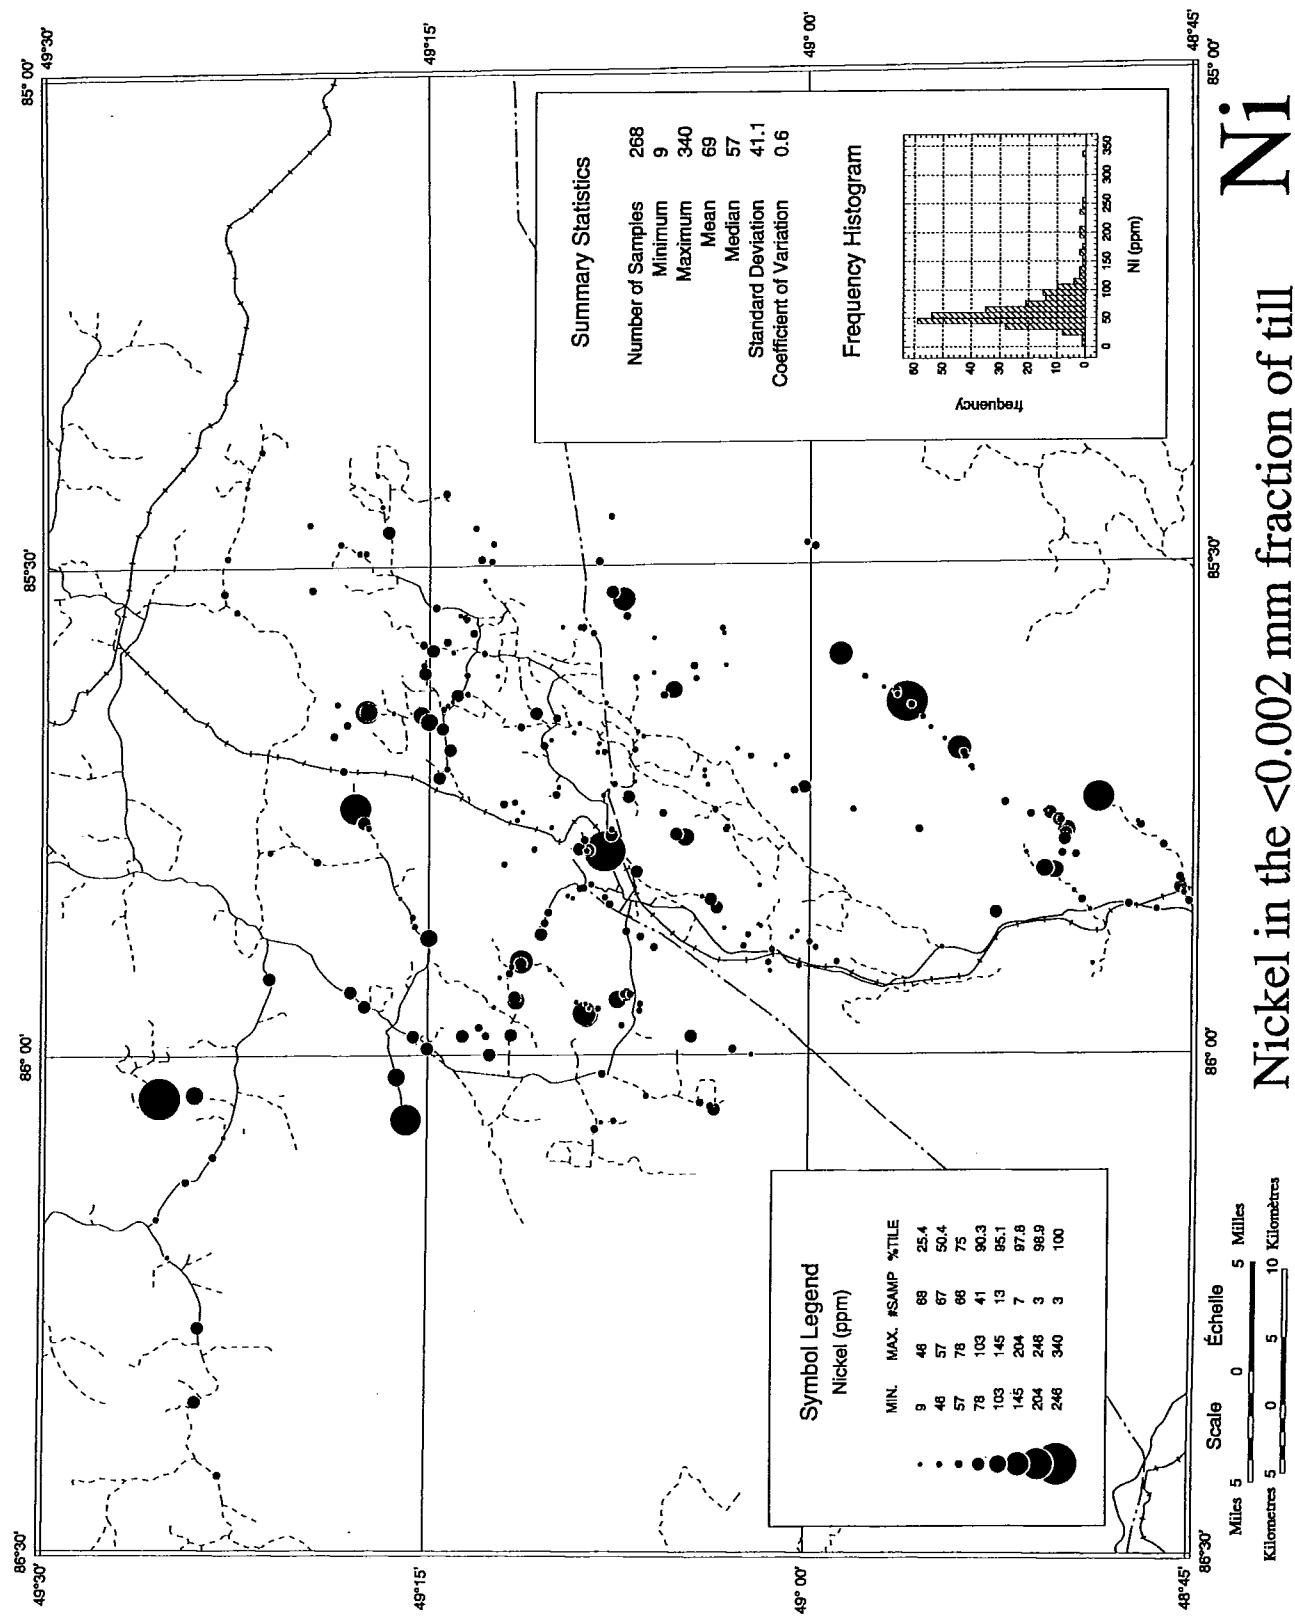

Manganese in the <0.002 mm fraction of till Mn

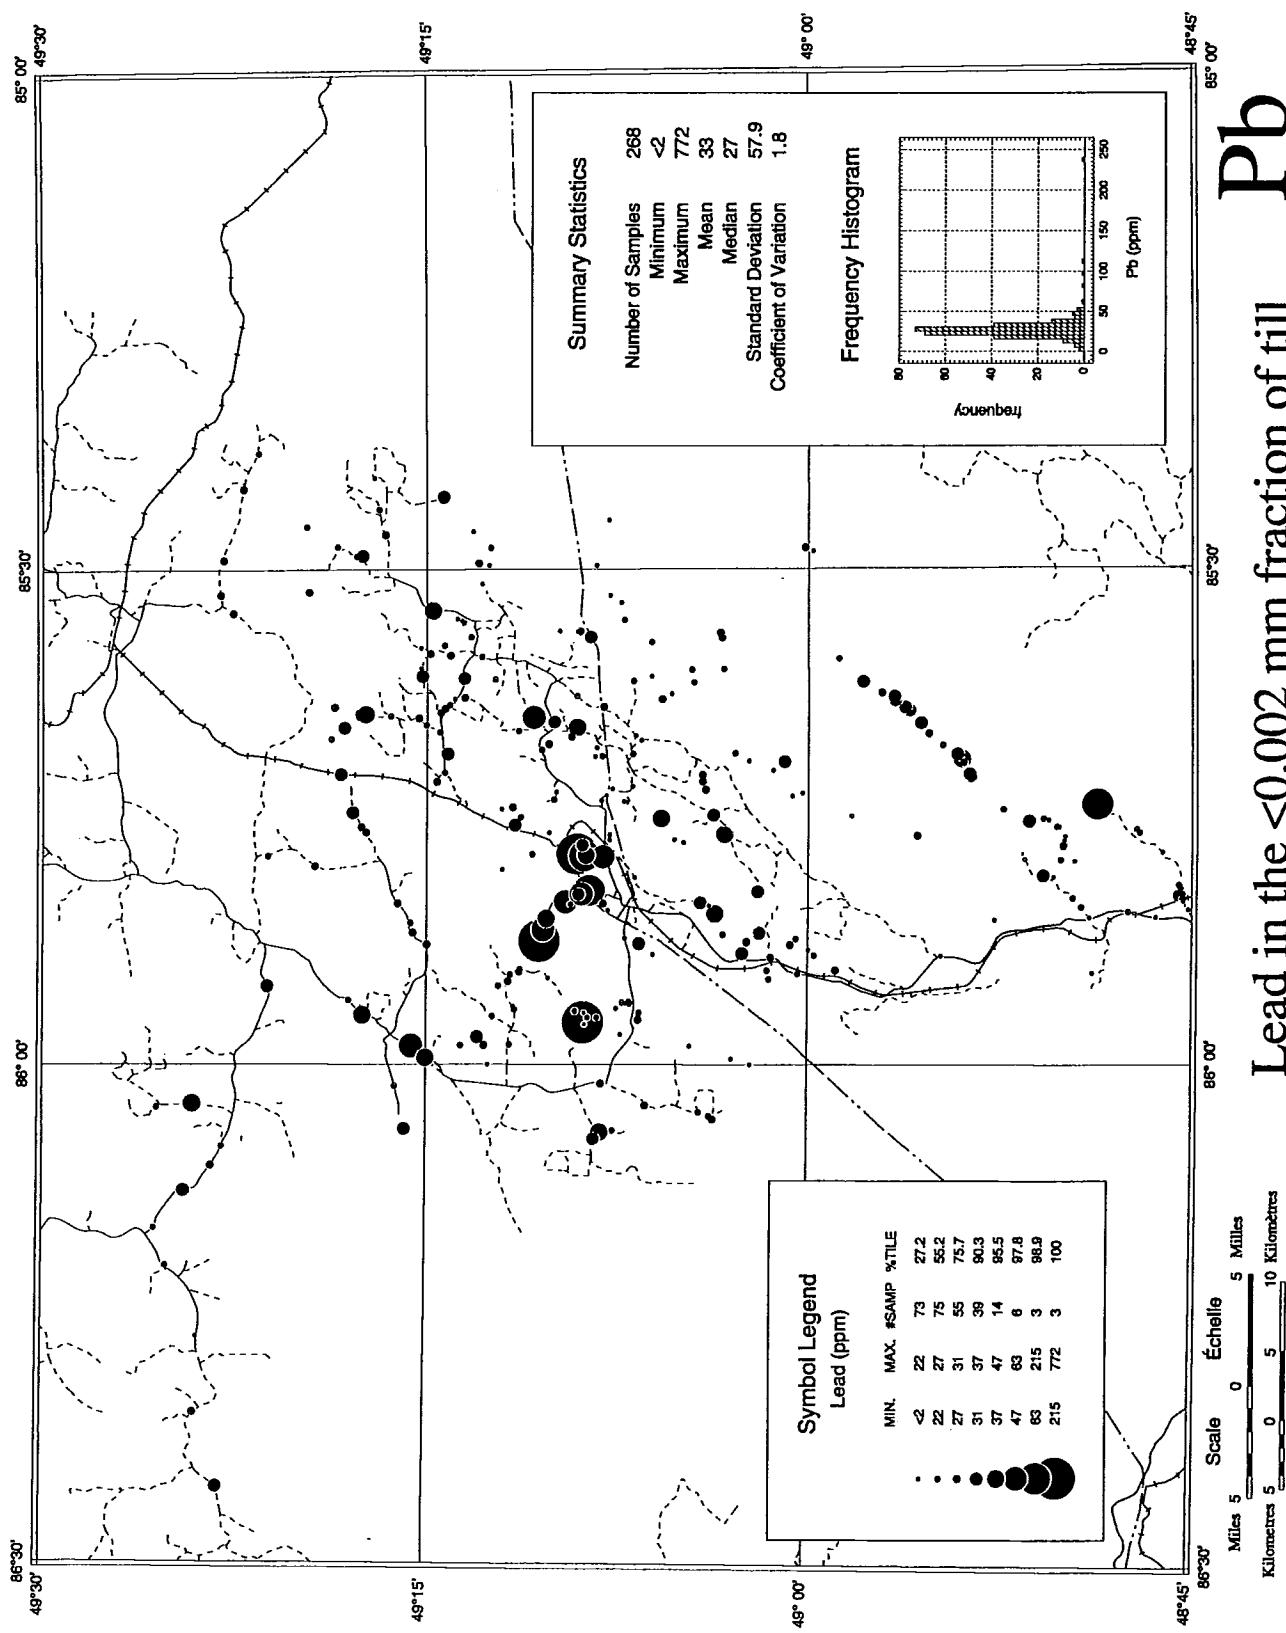

Molybdenum in the <0.002 mm fraction of till

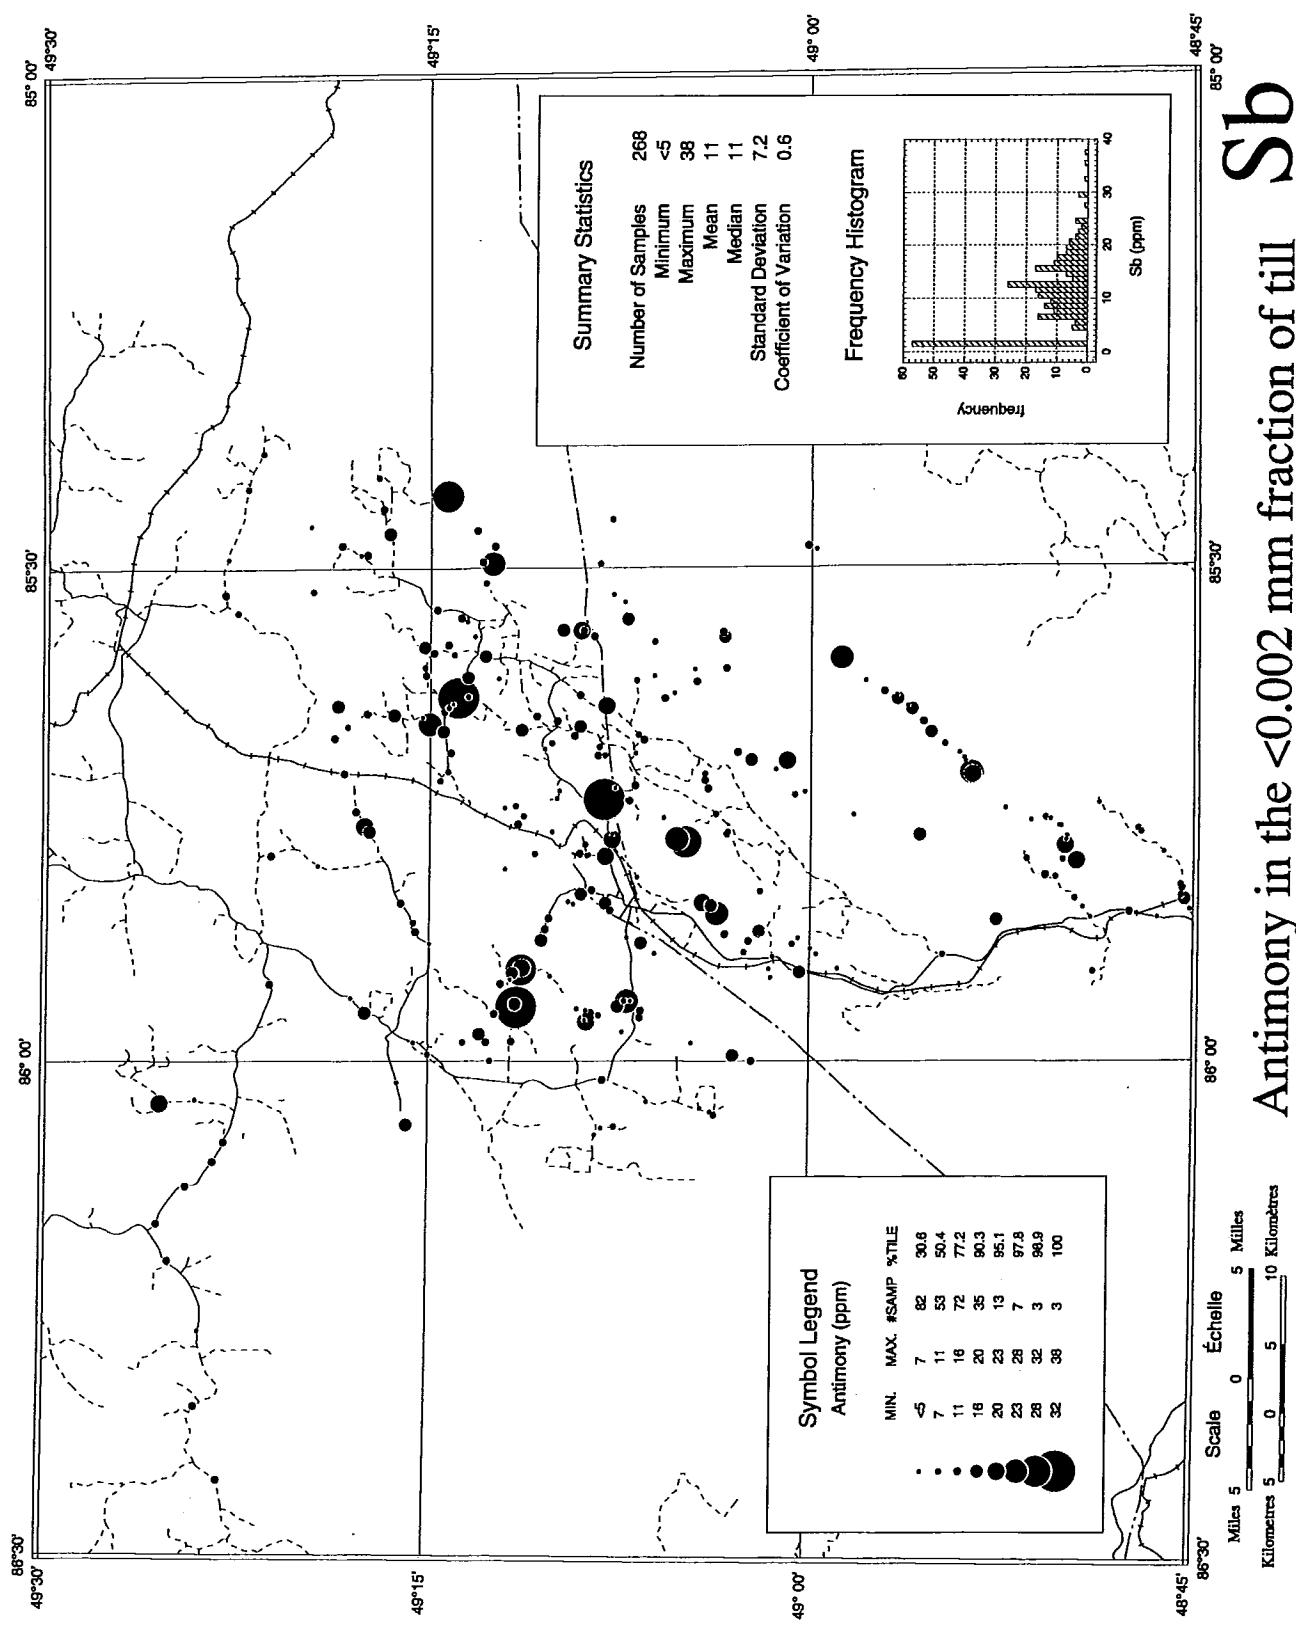

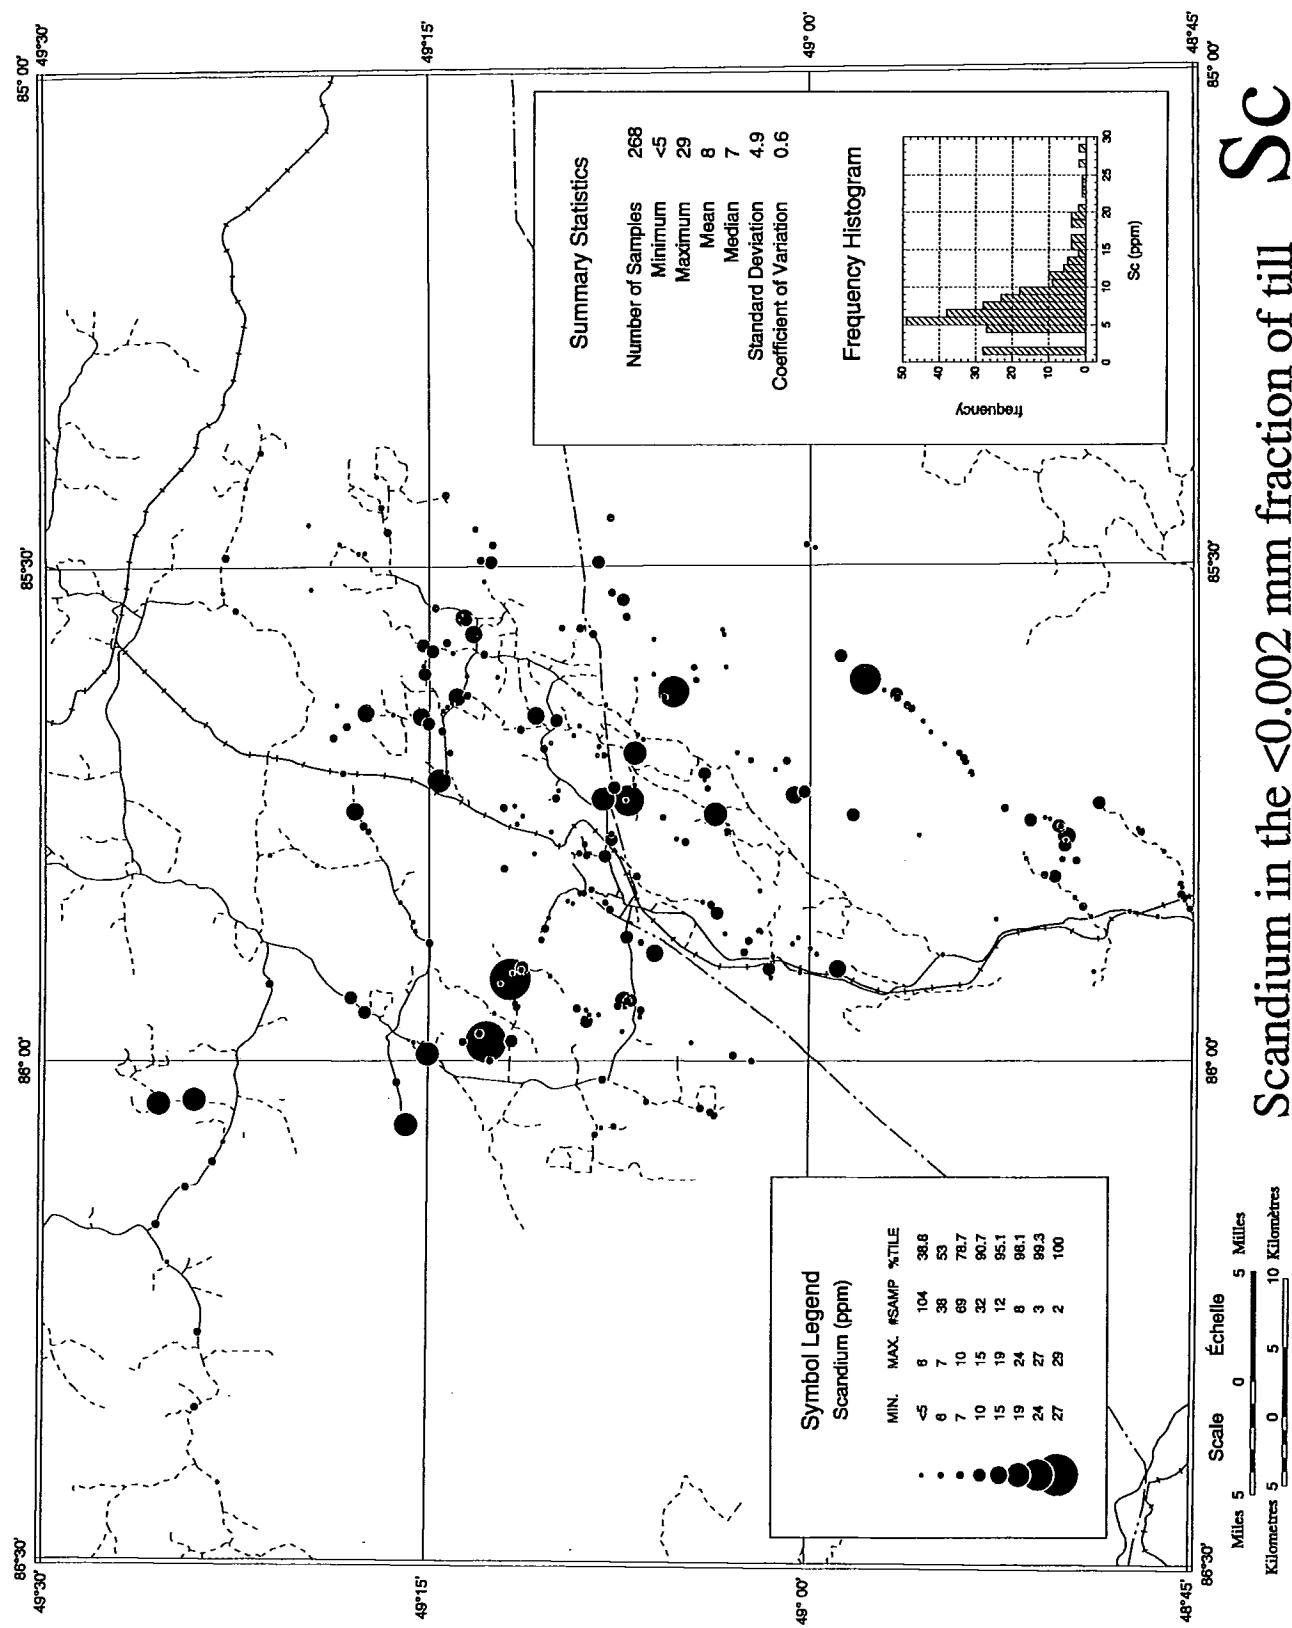

Pb

Lead in the <0.002 mm fraction of till

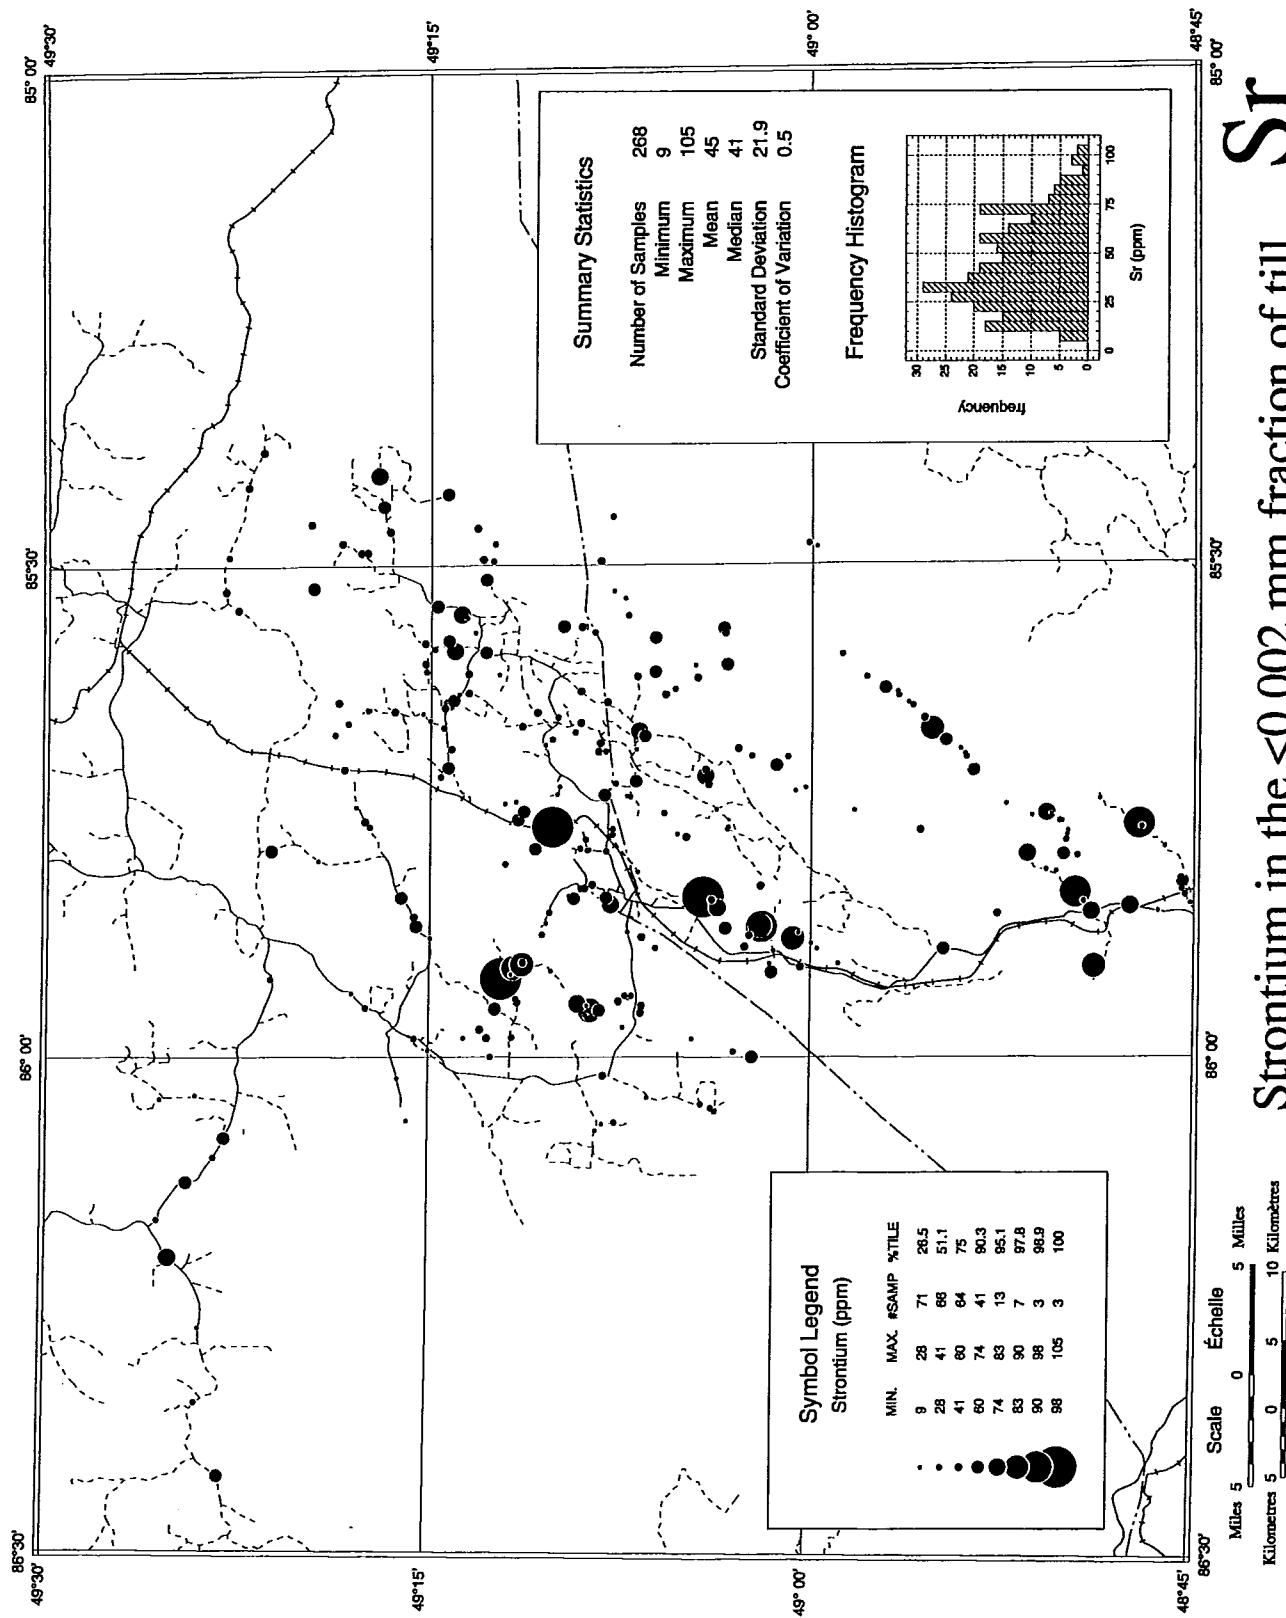

Sb

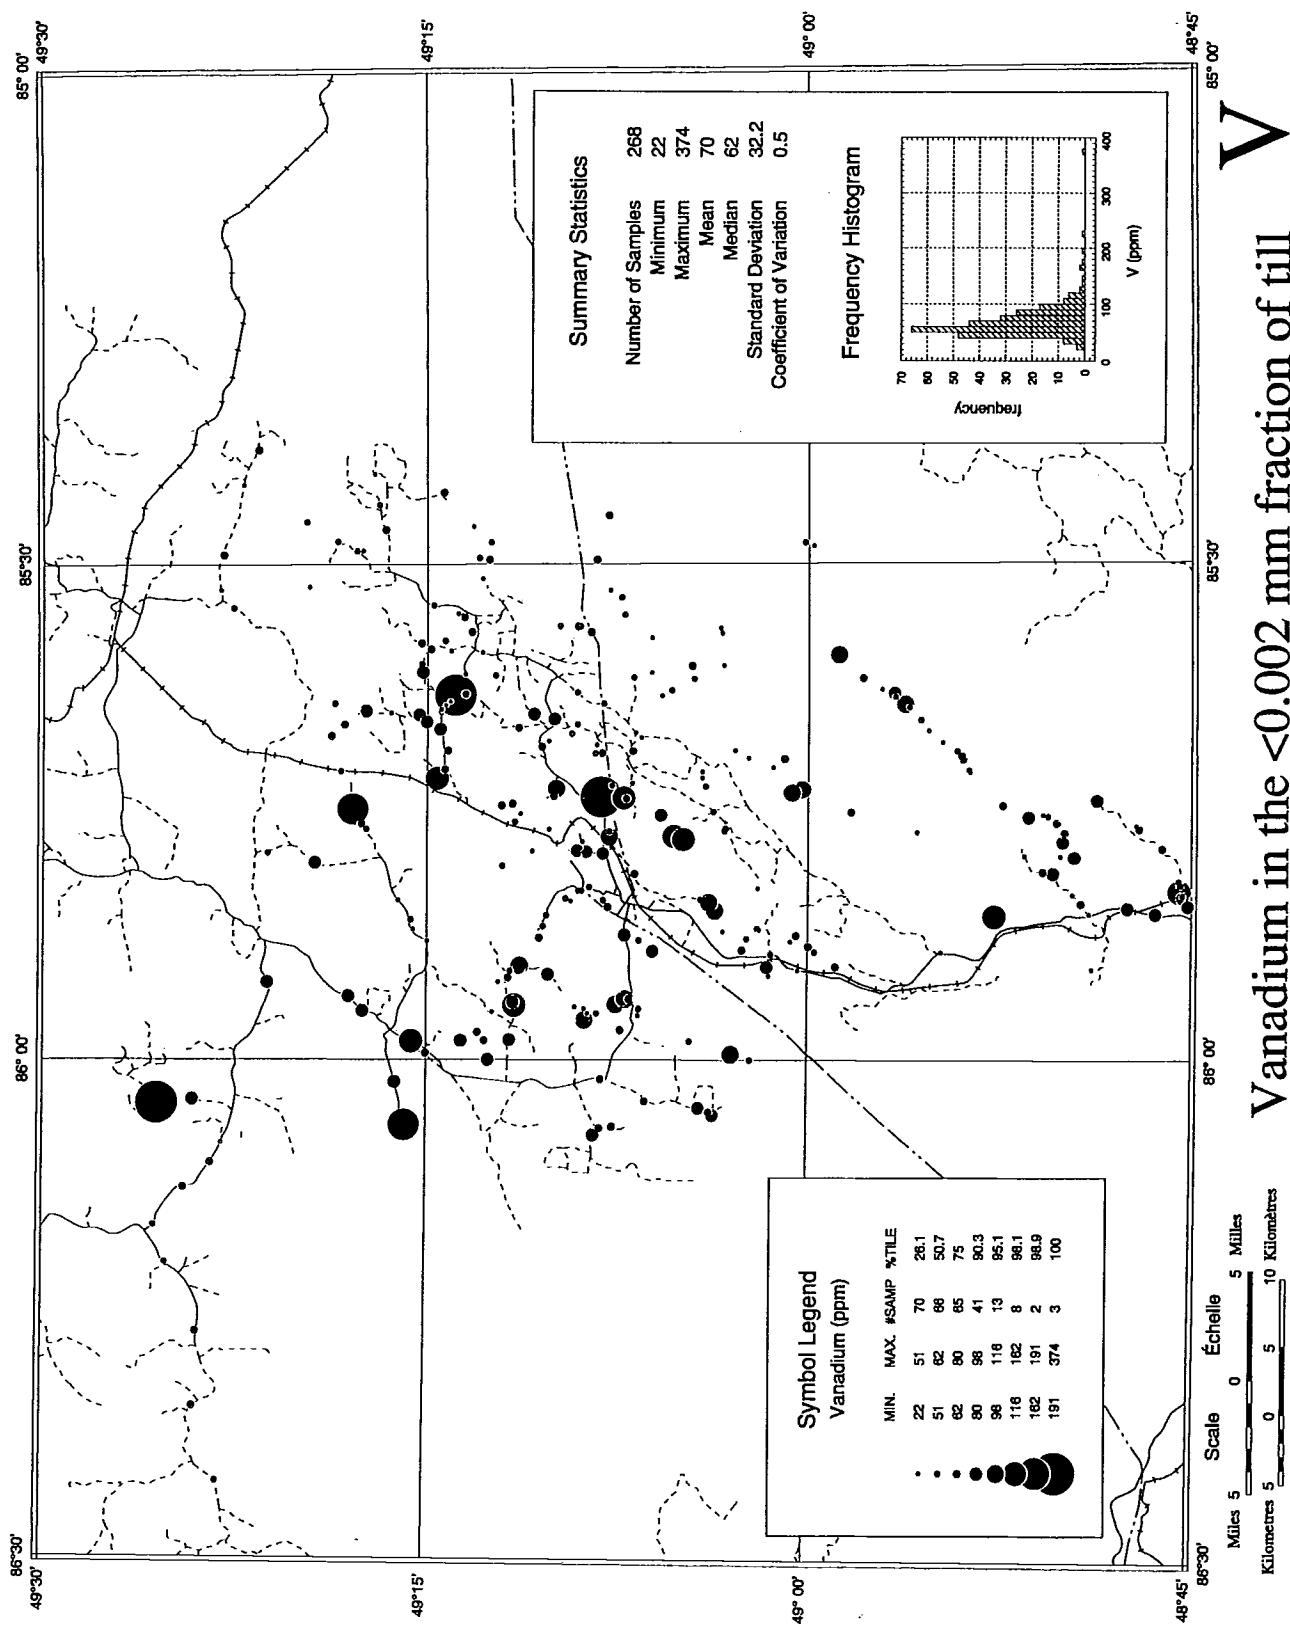

Sr

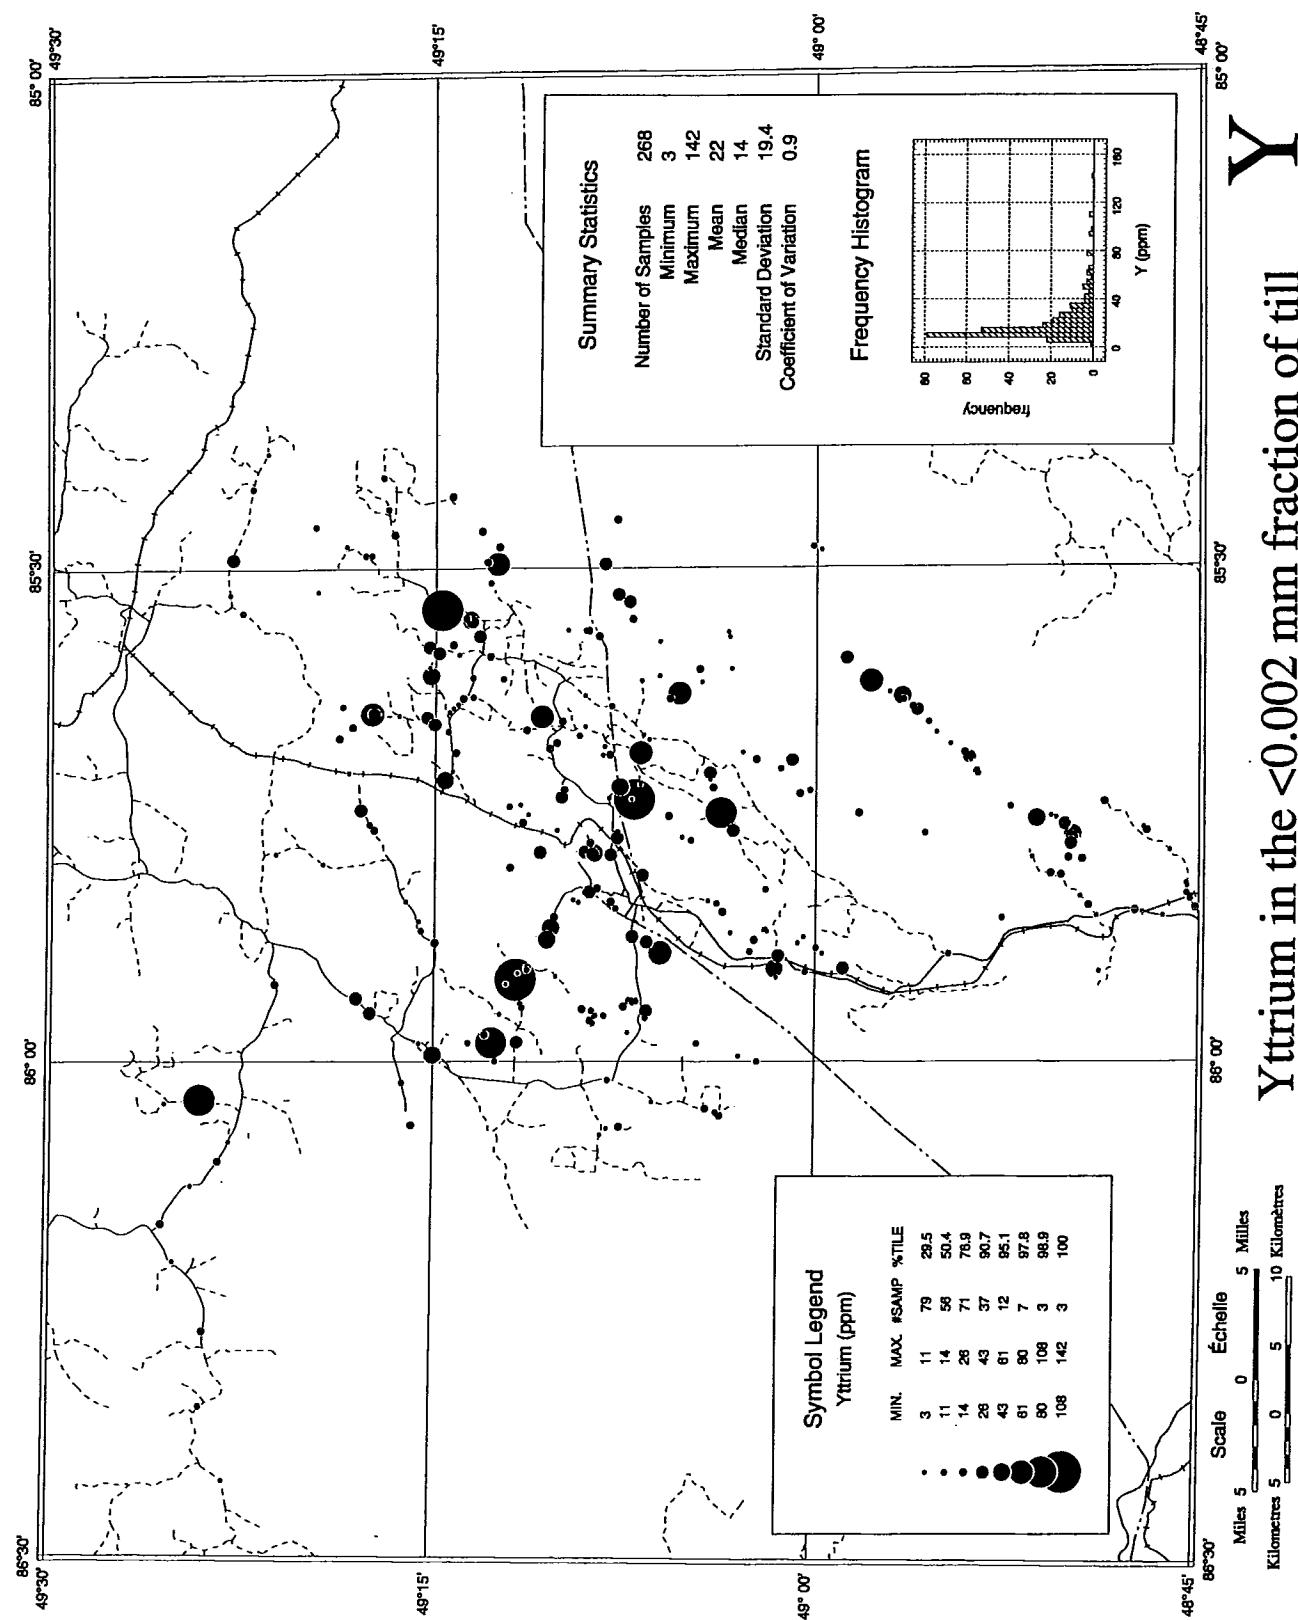

Strontium in the <0.002 mm fraction of till

V

Vanadium in the <0.002 mm fraction of till

Zn

Zinc in the <0.002 mm fraction of till
