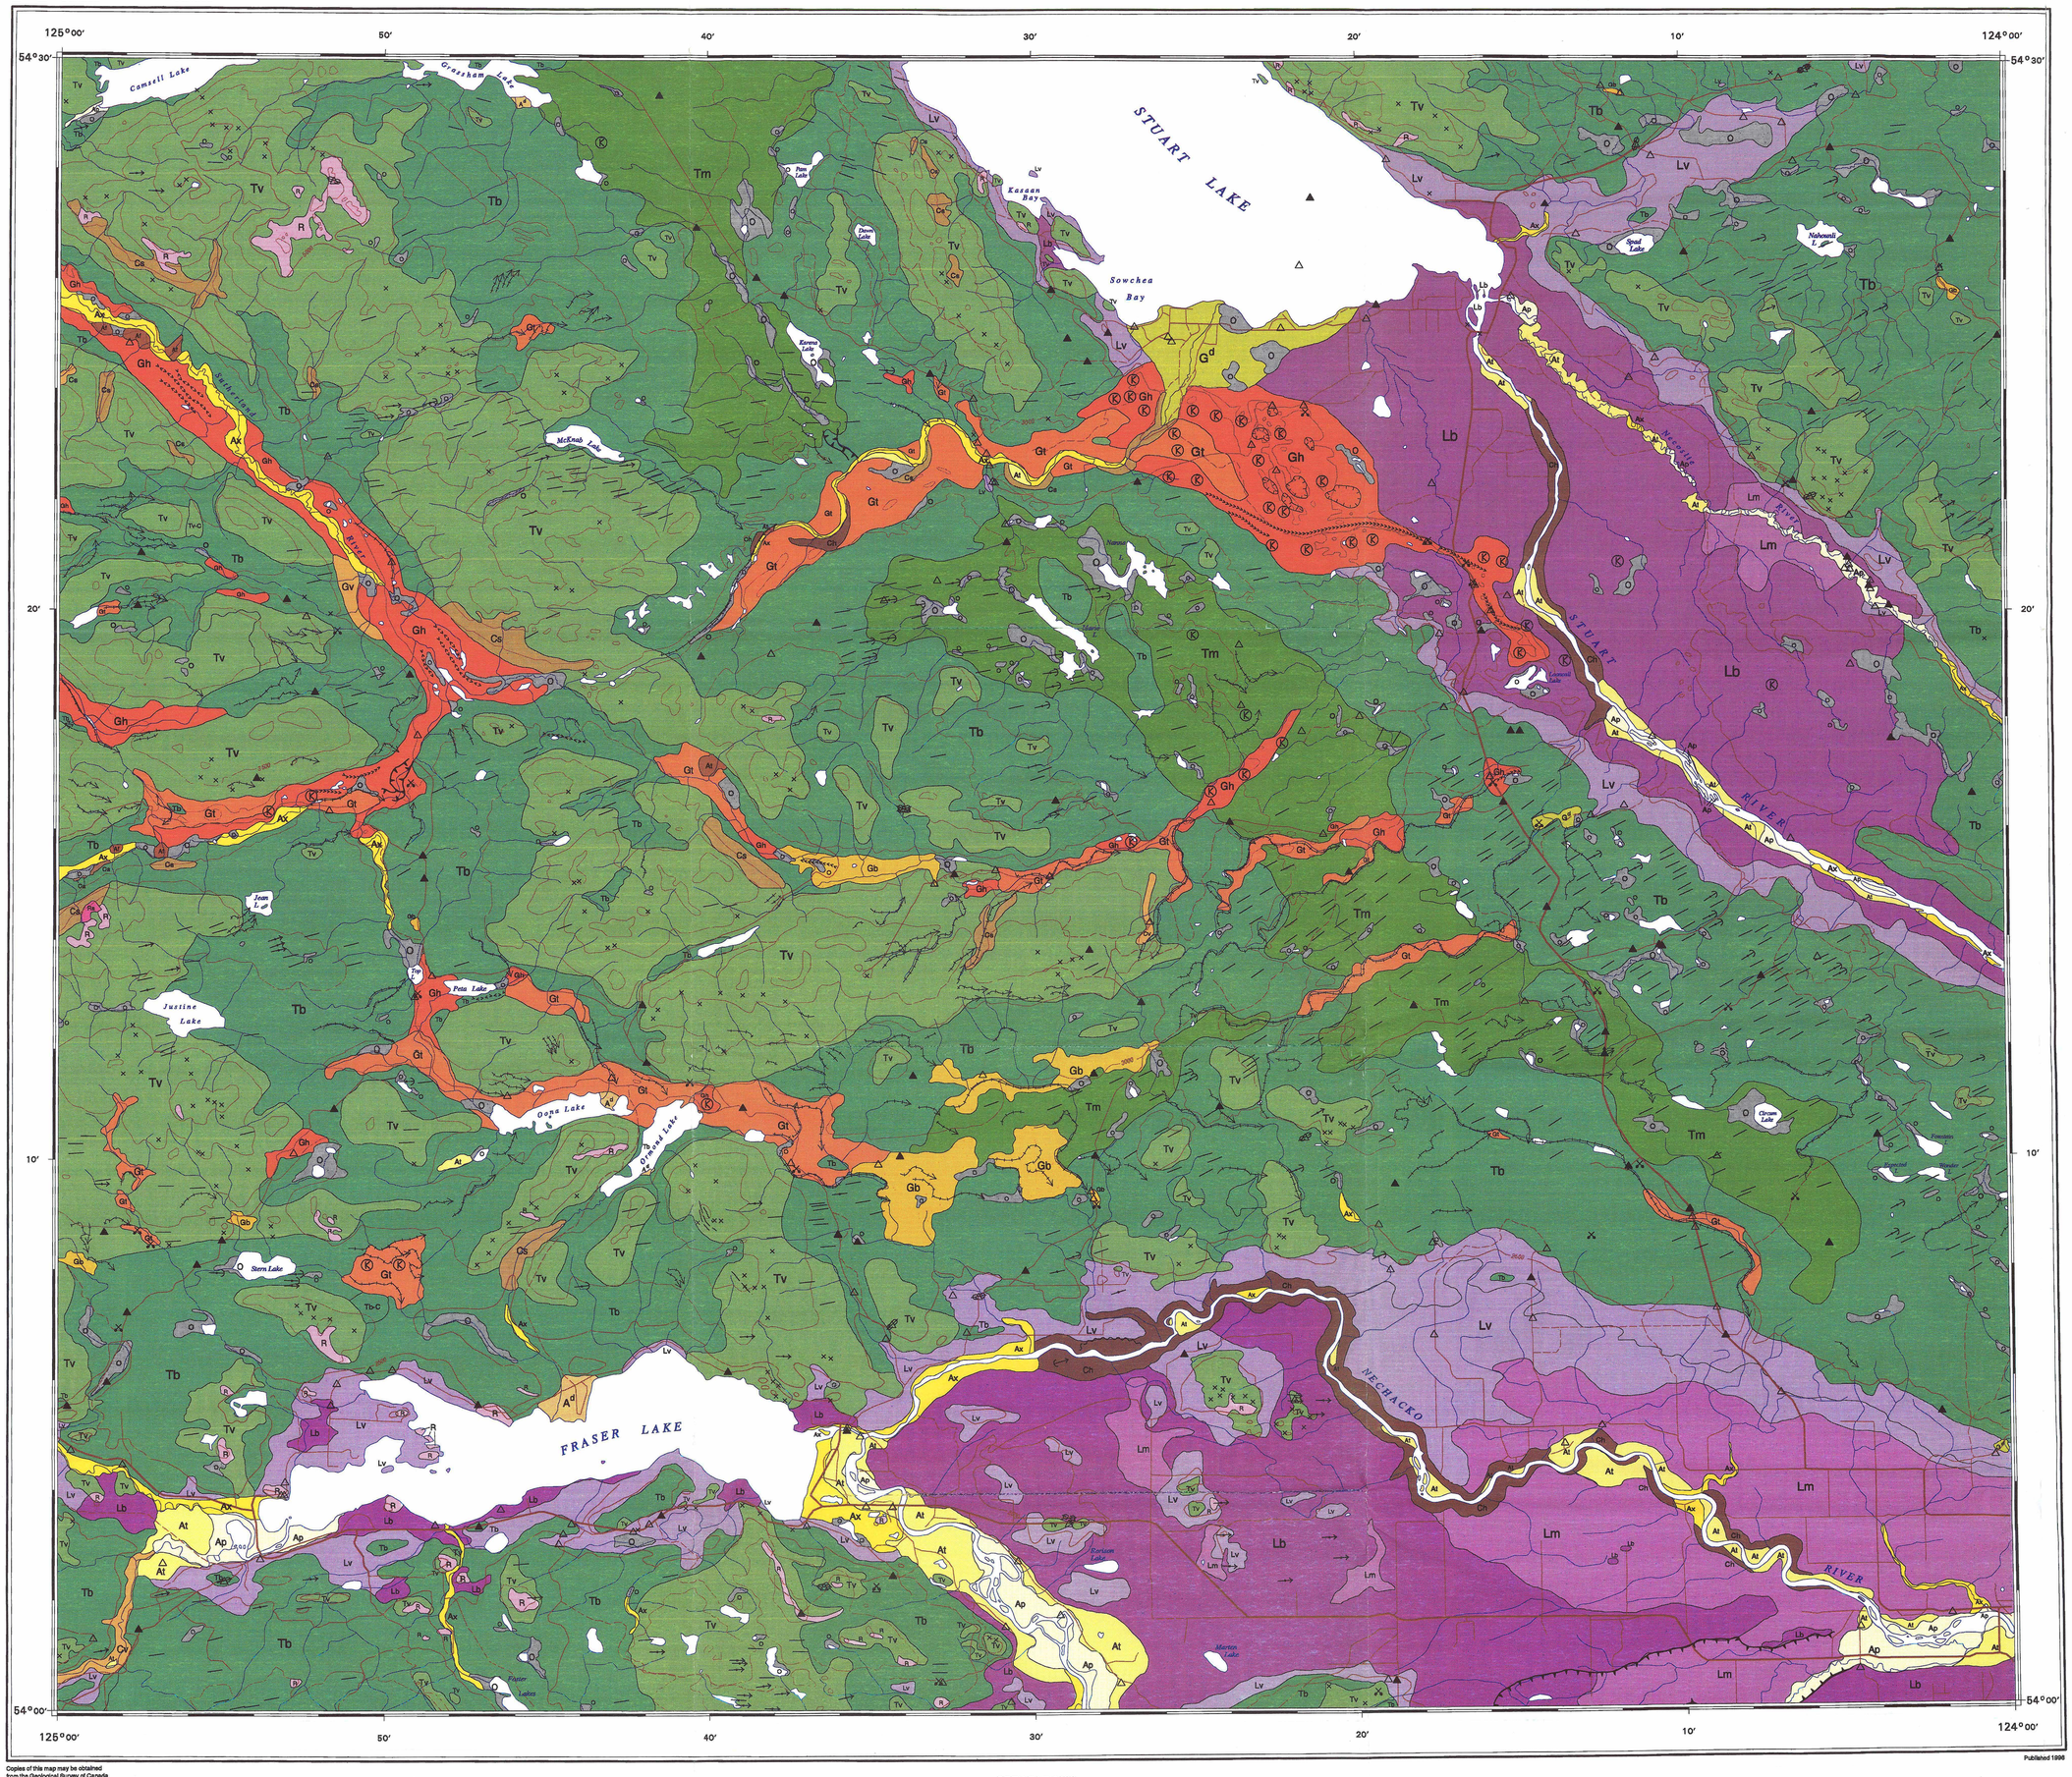
GEOLOGICAL SURVEY OF CANADA | COMMISSION GÉOLOGIQUE DU CANADA



LEGEND

O — *ORGANIC DEPOSITS: Peat and muck; occurs as poorly drained terrain such as fen and bogs; organic deposits too small to be shown at this scale occur within other units (e.g. within abandoned meltwater channels); average thickness of 3-4 m, maximum thickness 10 m*

ALLUVIAL (FLUVIAL) DEPOSITS: Deposits of streams and rivers, composed of well stratified to massive silt, sand and, gravel with minor clay; greater than 2 m thick

Ap — ***Floodplain sediments:*** *sand and silt, stratified to massive, commonly including discontinuous organic materials; in many places underlain by coarser gravel; occurs as flat surfaces close to river level; prone to periodic flooding*

At — ***Terrace sediments:*** *gravel overlain by a veneer of sand and silt; mostly well stratified; underlies level surfaces well above river level*

A^d — ***Deltaic sediments:*** *sand and gravel (generally greater than 2 m) underlain by silt and clay; occurs at or below present lake levels at the mouth of a stream*

Af — ***Fan sediments:*** *gravel, sand, silt, and clay; poorly sorted; occurs as a fan-shaped form at the toe of slopes and where streams debouch onto flat valley floor; composition is dependent on source materials*

Ax — *Sand, silt, and gravel with minor organic materials; consists of varying amounts of Ap, At and Af; overlain and intermixed with colluvium in areas of steep slopes*

COLLUVIAL DEPOSITS: Diamicton and rubble; material accumulated from various mass wasting processes varying from slope wash to rock falls. Composition is dependent on source materials

Cv — ***Colluvium veneer:*** *rock fragments in a matrix of sand, silt and clay, poorly sorted, discontinuous; commonly 1-2 m thick; mostly mapped on steep slopes (> 40°) of secondary valleys*

Ch — ***Landslide material:*** *sediments of various texture (dependent on source materials) with hummocky topography present at the bottom and on slopes affected by landslides; thickness generally greater than 3 m; predominantly in unconsolidated sediments; commonly but not uniquely found in terrain underlain by glaciolacustrine sediments*

Cs — ***Colluvium on steep slopes (> 40°):*** *cover of rock fragments in a matrix of sand, silt and clay; occurs largely in unconsolidated sediments; slopes show abundant signs of erosion such as gullies; 2-3 m thick*

Ca — ***Colluvial apron and talus:*** *rubble accumulations at the bottom of steep slopes (> 40°); includes high proportions of local bedrock fragments; commonly thicker than 5 m*

GLACIAL LAKE DEPOSITS: sand, silt, and clay deposited in a glacial lake; well stratified, commonly occurs as rhythmites with rare debris flow interbeds; sand is more abundant at elevation close to the former lake limit; outliers are common on adjacent units; contacts between subunits are gradational

Lv — ***Veneer of glacial lake sediments:*** *discontinuous cover of silt with minor sand and clay; includes shallow water deposits, i.e., well sorted sand near limits of former lakes; average thickness of 1 m*

Lb — ***Blanket of glacial lake sediments:*** *continuous cover of silt with minor sand and clay, not thick enough to completely mask the underlying topography; generally 2-4 m thick*

Lm — ***Rolling surface of glacial lake sediments:*** *continuous cover of silt with minor sand and clay which masks the underlying topography; more than 4 m thick*

GLACIOFLUVIAL DEPOSITS : Sand and gravel deposited by glacial meltwater. Eskers are too small to show as separate units at this scale of mapping and are indicated by symbol

Gt — ***Glaciofluvial terrace sediments:*** *sand and gravel, stratified to massive; occurs as terraces interpreted as glaciofluvial in origin because of their elevation above alluvial units or location in ancient meltwater conduits; average thickness is greater than 10 m*

Gh — ***Ice contact deposits:*** *coarse sand and gravel, deposited in contact with glacier ice; surface is hummocky and may include kettle depressions; locally can include Gt; generally greater than 3 m thick*

Gb — ***Blanket of glaciofluvial sediments:*** *sand and gravel, stratified to massive; sediment cover is continuous but fails to obscure the underlying morphology; greater than 2 m thick*

G^d — ***Proglacial deltaic sediments:*** *coarse sand and gravel, underlain by sand and silt; deposited as a delta in a glacial lake; more than 10 m thick*

TILL: deposits of glacier ice; consists of rock fragments of all sizes in a sandy to clayey matrix, but usually sandy silt; includes colluvium on steeply sloping terrain and isolated outcrops, and small inclusions of glaciofluvial sediments especially in valley bottoms and where the suffix "c" is used (abundant meltwater channels e.g Tv-c)

Tm — ***Thick till, hummocky:*** *till cover which masks the underlying topography; surface expression generally undulating with drumlinoid features common; bedrock outcrops are absent; sediment thickness greater than 3 m*

Tb — ***Till blanket:*** *till with scarce bedrock outcrops; more than 1 m thick*

Tv — ***Till veneer:*** *till with abundant bedrock outcrops; less than 1 m thick; Tv-c- area marked by abundant meltwater channels*

BEDROCK: Sedimentary, metamorphic, volcanic, and intrusive rocks of Precambrian through Cenozoic age

R — ***Bedrock:*** *mostly outcrop but with local thin patches of till and colluvium which rarely exceeds 2 m*

Rs — ***Steep bedrock:*** *outcrop on steeply sloping terrain, patchy cover of till, colluvium and local bedrock fragments increase in abundance downslope; includes alpine areas typified with arêtes and cirques*

- *Geological boundary*
- *Landslide scar (small, large)*
- *Abandoned meltwater channel, large*
- *Abandoned meltwater channel, small (flow direction known, unknown)*
- *Kettle hole (small, large)*
- *Esker (direction of former water flow known, unknown)*
- *Drumlin (direction of flow known, unknown)*
- *Crag and tail*
- *Glacial fluting*
- *Glacial striae (direction of ice flow known, unknown)*
- *Glacial striae subdued (direction of ice flow unknown)*
- *Bedrock lineation*
- *Outcrop*
- *Gravel pit*
- *Field observation and sampling site*
- *Field observation site*
