Abstract

Information from the literature on swarm geometry, geochronology and key references for more than 500 diabase (dolerite) dyke swarms from around the world are displayed on a 1:35,000,000 scale map and catalogued in a companion report. This compilation has so-far facilitated the identification of nearly 30 giant radiating swarms, the focal points of which are interpreted to locate mantle plume centres.

Introduction

This report, which was prepared for the Global Mafic Dyke GIS Database Project, catalogues information on the 523 diabase (dolerite) dyke swarms which are also displayed on the accompanying map. Another 157 swarms (and subswarms) are also listed but not displayed on the map due to space limitations or small swarm size.

The swarms represented in the compilation are broadly basaltic in composition and typically exhibit the diabasic or doleritic (ophitic, subophitic to intergranular) texture of coexisting plagioclase and pyroxene (e.g. Bates and Jackson 1980 [48]; Basaltic Volcanism Study Project 1981, pp. 368-369 [44]). The compositions range from tholeiite to weakly alkaline (e.g. alkali olivine basalt) and include metamorphosed equivalents. We also catalogue the important group of boninitic-noritic (high-Mg) swarms (e.g. Hall and Hughes 1987 [234], Bridgewater et al. 1995 [92]). Dykes associated with ophiolites and oceanic islands have not been systematically included. Strongly alkaline, lamprophyre, and kimberlite dykes are excluded.

Table 1 compiles geographical information about swarms (location, swarm size, trend, etc.), age constraints and key references.

In Table 2 swarms of approximately the same age are grouped into giant radiating patterns whose convergent points are thought to locate mantle plume (head) centres. The basis for this approach is discussed in Ernst et al. (1995a,b [182], [183]). Each of the case histories in Table 2 is detailed in Ernst and Buchan (subm. [181]) which explores the relationship between giant radiating dyke swarms, mantle plumes and large igneous provinces.

This publication represents the first global review of diabase (dolerite) dyke swarms. It is anticipated that subsequent editions will include additional swarms including those of ophiolite sheeted dyke complexes and oceanic islands as well as additional types of information such as petrology (petrography, geochemistry, isotope studies, degree of metamorphism), paleomagnetism, and related volcanic/plutonic units. Additions and corrections to the present edition are welcomed and should be addressed to REE or KLB. For easy location of the full citation in the reference list, each reference in the text and tables is accompanied by a locator number (in square brackets).

Acknowledgements

Information in this compilation derives primarily from the published literature. However, we are indebted to the many scientists from around the world who identified or provided key publications and maps, or who helped us to distinguish dyke swarms on a regional scale. We wish to especially thank Niels Abrahamsen, Tahar Aifa, Bob Baragar, Hewitt Bostock, Paul Budkewitsch, Ken Card, André Ciesielski, L. Correa-Gomes, John Craddock, Kent Condie, Piero Comin-Chiaramonti, Clay Conway, Tony Davidson, Andy Duncan, D.H. Elliot, Ron Emslie, Ingo Ermanovics, Marcia Ernesto, Moshe Eyal, Yehuda Eyal, Tony Frith, Sunil Gandhi, Henry Halls, Steve Harlan, Joe Hodych, Hans (J.D.) Hoek, Garth Jackson, Dai Jones, Steve Kumarapeli, Ilkka Laitakari, Tony LeCheminant, Jim Mortensen, Sasha Okrugin, E. Oliveira, John Parker, Lauri Pesonen, Rob Rainbird, M.I.B. Raposa, D.L. Reid, Peter Rickwood, Oleg Rosen, Marty Ross, Bruce Ryan, Nikolai Shatalov, John Sheraton, B.R. Shpount, George Snyder, Olaf Svenningsen, Wilson Teixeria, Misha Tomshin, Martin van Kranendonk, Jouni Vuollo, Marie-Claude Williamson, and Karl Wirth. Walter Fahrig's unpublished files, archived at the Geological Survey of Canada, have been useful in directing us to some important references on dykes of the Canadian Shield. Much feedback was obtained on a draft version of the map displayed at the 3rd International Dyke Conference meeting in September 1995 in Israel and the organizers of this conference, Gidi Baer and Ariel Heimann should be thanked for establishing an effective venue for collaboration. Bob Baragar has provided a detailed review of this publication; however any errors or omissions are our responsibility. We also thank the staff of the Geological Survey of Canada libraries, particularly Irène Kumar of the map library, Judith Boucher in interlibrary loan and Nina Aubé, Sari Burgoyne, Anne Dickason and Cheryl Love in circulation for assistance in locating maps and other references. REE and HCP received financial support from a LITHOPROBE CANADA grant. This publication is LITHOPROBE CANADA number 732.

Table 1: Catalogue of Diabase (Dolerite) Dyke Swarms of the World

The headings in Table 1 are explained as follows:

Map Label: For the purpose of this catalogue, landmasses of the world have been grouped under the following conventional "continent" labels (National Geographic Society, 1992 [391]): A = North America (including Greenland), B = South America, C = Europe (bounded on the east and south by the Ural Mountains and the Mediterranean, Black and Caspian seas; includes Svalbard), D = Asia (bounded on the west and southwest by the Ural Mountains, Caspian, Black and Red seas), E = Africa (bounded on the northeast by the Red Sea; includes Madagascar and the Seychelles Islands), F = Australia (includes New Zealand), G = Antarctica. Within each continent, dyke swarms are numbered in order of decreasing age.

Swarm Name: Alternative names are in parentheses, former names are in square brackets; swarms which appear to be unnamed have been assigned provisional names (underlined) for the purposes of this compilation. Names were typically drawn from nearby towns or rivers in which case the spelling is usually that given in the National Geographic Atlas of the World (National Geographic Atlas 1992 [391]). For swarms named after tectonic domains, the spelling has generally been drawn from Goodwin (1991 [219]). Entries which are indented and fronted by dashed lines represent separate portions of a swarm and in some cases may represent distinct subswarms (Ernst et al. 1995 [183])

Location: Either the estimated geographic centre of the swarm, or a distinctive region of the swarm. Northeast, northwest, central etc. are abbreviated by ne., nw. and c. etc. Location is given as latitude, longitude.

Age: Age as reported in the literature. Entries are arranged in approximate order of decreasing age. Very poorly dated swarms are grouped in alphabetical order at the end of each table. Dating techniques includes U: U-Pb; R: Rb-Sr; K: K-Ar; A: Ar-Ar; S: Sm-Nd; G: geological correlation; P: paleomagnetic correlation to dated units or dated apparent polar wander paths. Where ages were reported in time-stratigraphic names (e.g. Jurassic), they have been converted to absolute age according to Okulitch 1995 [401].

Trend: Information on the trend(s) of dykes. The system is explained with a complicated example: 50° (40-70°), 100°, {330}, {NE-N}. There are four grouping of trends here. The main are 50° and 100° and the minor are 330° and NE-N. The range of the 50° set is 40-70°. Where possible, trend values are quoted between N to SSE or 0° to 179°, except when necessary, (e.g. a swarm fanning from NNE to NNW). For fanning swarms, trend polarity is chosen relative to the focal point.

Length and Width: Estimated to the nearest 50 km for the giant swarms (>300 km long) and to about 10 km for smaller swarms. In the case of fanning swarms, the **Length** value in parentheses is the maximum distance from the plume centre given in **Focus** and in Table 2. **Width** for swarms fanning more than approximately 100° is not given, but is usually listed for component subswarms.

Fan-Angle: Minimum angle of fanning. Isolated outlier dykes not included in calculation. Fan-angles <20° are not presented.

Focus or Source Direction: Focal point of a fanning swarm or direction to the magma source as given by flow directions determined from observed textures, dyke bifurcations, and/or magnetic fabric measurements. There are two exceptions. For the Grenville swarm (A84) the listed location is that of the pre-thrust position of the Tibbit Hill volcanics (thought to locate a mantle plume (St. Seymour & Kumarapeli 1995 [509])). For the Abitibi swarm (A67) the location is that of the Goodman Swell (Peterman and Sims 1988 [431]) for reasons discussed in Ernst et al. (1995 [183]).

Selected References: General references on the distribution and character of swarms as well as their age. References specifically chosen for geochronology are coded 'a' for age. The cited references are compiled at the end of the table. Numbers in square brackets provide an easy link to the full citations in the reference list.

Additional information is provided in **Notes** at the end of each (continent) section of the table.

Notes

¹Fahrig & West (1986) [197] consulted for the geometry of most swarms of the Canadian Shield.

²**Lac de Gras:** The Lac de Gras swarm converges slightly to the north (LeCheminant 1994 [329]).

³**MD:** MD stands for metadolerite.

⁴**BN-1, BN-2** = Boninitic-Noritic (Hall & Hughes 1987 [234]).

⁵**Wyoming Block-1:** The 1450 Ma dykes of the Wyoming Block-1 swarm are found in the Tobacco Root Mtns., Beartooth Mtns., Wind River Mtns., Granite Mtns., Hartville Uplift and perhaps in the Colorado Front (Snyder et al. 1989 [498]).

⁶**Wyoming Block-2:** 780 Ma dykes of the Wyoming Block-2 swarm are found in the Beartooth Mtns., Tobacco Root Mtns. and Tetons (Snyder et al. 1989 [498]; Harlan 1993 [250])

⁷**Charleston:** The Charleston swarm converges slightly to the south.

Swarms linked with names of individual dykes and subswarms

¹Åland swarm (~1550 Ma) = Åboland, Föglö, Sottunga, Bergskär, Västersten, Höggrund, Källholm, Vidskär

Kumlinge-Bergskär, Kumlinge-Brändö

Reference: Pesonen et al. (1991) [429]

²Protogine Zone-2 swarm (1180 Ma) = Röshult, Krängshult, Taberg, Bondstorp, Rumperöd, Kräbbleboda, Assaretorp

Reference: Johansson & Johansson (1990) [293]

³Blekinge swarm (930 Ma) = Fäjö, Lösen, Ramdala, Verköon, Tattamåla, Karlshamn, Bräkne-Hoby I, Bräkne-Hoby II

Reference: Johansson & Johansson (1990) [293]

³Blekinge swarm (~950 Ma) = Karlshamn, Bräkne-Hoby, Årby, Västra-Nornäs, Falun

Reference: Patchett et al. (1994) [423]

³Blekinge swarm (~950 Ma) = Fäjö, Tärnö, Karlshamn, Bräkne-Hoby, Årby (dyke?), Nilstorp (sill), Forserum (sill), Västra-Nornäs, Falun, Baby

Reference: Patchett & Bylund (1977, Fig. 1)) [422]

³Blekinge swarm (840 Ma) = Härsjön

Reference: Johansson & Johansson (1990) [293]

⁴Protogine Zone-3 swarm (930 Ma) = Duvhult, St. Björkeröd, Häggihult, Värestorp, Bjärlöv

Reference: Johansson & Johansson (1990) [293]

⁵Oslo rift swarm (~250-300 Ma) = Tonsåsen, Bagn-Ådal, Mjøndalen-Etnedal, Katfoss, Nakkerud, Roa, Bjørnvika, Brandbu, Gran, Jevnaker, Nesodden, Ekeberg, Tyvholmen, Storhaug, Raftötangen, Bjørnvika, Brandbu

Reference: Sundvoll & Larsen (1993) [522]

⁶Reference added in proof: Caroff et al. 1995 (Canadian Journal of Earth Sciences, v. 32, p. 1921-1936.)

¹Mashaba-Chibi dykes have trends and distribution which appear to form the remains of a modified radial and ring pattern (Wilson et al. 1987 (p. 437) [597]).

²Afar: Component swarms include: ‘western Afar margin’, Bashillo, Guder, Semien shield-1, Semien shield-2, Cawa caldera, Amaro horst, Sagatu (Mohr & Zanettin 1988 (fig. 3 & pp. 83-84) [368]).

³These swarms may include non-diabases (Vail 1978 [567]).

⁴SE Mauritania: a possible component of the 200 Ma Central Atlantic reconstructed radiating swarm (Table 2). Included as part of the swarm by May 1971 [358], but not by Oliveira 1990 [406].

⁵Sudan: includes dyke concentrations near Derudeb, the Nuba Mountains, the Third Cataract, Darfur, Sodiri (in central Kordofan) and Merowe. Given the absence of dating, each of these regions could represent separate swarms.

Table 2: Mantle Plume Centres Interpreted from Converging Swarms

The headings in Tables 2 are explained as follows:

Map Label: Plume centres labelled in order of decreasing age. A question mark preceding the label indicates that the interpretation of a mantle plume is uncertain. Where different components of the swarm are on separate continents, the location of the plume relative to each block is given and an additional letter indicates the continent (a= North America, b= South America, c= Europe, d= Asia, e= Africa, f= Australia & g= Antarctica).

Name of Event (Approximate Location of Plume Centre): Assigned magmatic event name and plume centre location determined from the geometry of the dyke swarm.

Approximate Maximum Distance from Focus: The distance measured from the plume centre to the most distal portion of the radiating pattern. This number can be very uncertain given the very large uncertainties in the identification of plume centres.

Overall Fan Angle: The angle subtended by the reconstructed radiating pattern.

Component Swarms: The component swarm names and labels are keyed both to the map and Table 1.

Age: Ages from Table 1.

Dyke Criteria for Identifying Plume Centre: Description of criteria used to define plume centres based on dyke swarms. Other criteria can be found in the references.

Related Volcanic and Intrusive Units: Important volcanic and intrusive units which have similar age to the dykes and are probably related.

References: Selected references.

Each of the plume centres listed herein is described in more detail in Ernst and Buchan subm. [181].

Map Label	Name of Event (Approximate Location of Plume Centre)	Approximate Maximum Distance From Focus	Overall Fan Angle	Component Swarms	Age of Dyke Magmatism (Ga)	Dyke Criteria for Identifying Plume Centre	Related Volcanic & Intrusive Units (near focal region except where noted)	Reference for Identification of Plume (or triple junction)
P1	Mistassini (50°N, 71°W)	700	35°	Mistassini (A8)	2.47	fanning of A8		Fahrig et al. 1986 [193]

--P24a	--Greenland portion (68°N, 33°W)	900	180°	E. Greenland Tertiary (A109)	~0.060		E. Greenland volcanism and intrusions; Disko Island volcanism	
--P24c	--UK portion (58°N, 19°W)	1250	0°	British Tertiary (C74)	~0.060		British Tertiary volcanism and intrusions	
P25	Columbia River (Yellowstone plume) ~(42°N, 117°W)	600	~40° (195° with A107)	Chief Joseph (A111) Monument Valley (A112) Cascade Range (A113) Nevada rift (A115)	0.017-0.014	convergence of A111-A113 & A115	Columbia River volcanism & intrusions	Parsons 1994 [419] Ernst & Buchan subm. [181] Zoback et al. 1994 [616]
P26	Afar (12°N, 44°E)	2050	~100°	Red Sea (D64) Afar (E75)	~0.020		Ethiopian & Yemeni volcanism & intrusions	Mohr & Zanettin 1988 [368] White & McKenzie 1989 [592]
VERY POORLY DATED EVENT								
?P27	McArthur Basin (11°S, 135°E)	400	50°	McArthur Basin-1 (F47)		fanning of F47		Tucker & Boyd 1987 [558]

¹Keweenawan volcanic and intrusive rocks are located in the focal region of the Abitibi swarm but are 30 - 55 Ma younger (e.g. Paces & Miller 1993 [410]).

²Tibbit Hill volcanic rocks are located in the focal region of the Central Iapetus swarm but are 45 Ma younger (Kumarapeli et al. 1989 [320]).
