LEGEND

Not all coloured units and symbols in legend necessarily appear on this map
This legend is common to maps 1925A to 1936A

QUATERNARY

HOLOCENE - Post Erratics Train Glaciation

m — ***MADE LAND:*** *Artificial fill and mine waste*

I — ***EXISTING GLACIERS, ICE:*** *Flowing or stagnant glacial ice; contains or is covered by variable amounts of rock debris ranging from clay to boulders; thickness of ice 20 - 40 m*

O — ***ORGANIC SEDIMENTS:*** *Water-saturated* ***Sphagnum*** *peat and organic silt formed predominantly by the accumulation of vegetal material in bogs, fens, and swamps; organic deposits are usually underlain by lacustrine silt and clay; thickness up to 5 m*

EOLIAN SEDIMENTS: *Sand and silt transported by wind*

Eb — ***Eolian blanket:*** *Sand, well sorted, massive; forms gently undulating plains marked by crescent-shaped dunes; thickness up to 5 m*

COLLUVIAL SEDIMENTS: *Stony diamicton resulting from the mixture of varying amounts of broken bedrock, soil, and glacial sediments by nonfluvial gravitational processes such as creep, solifluction, debris flow, snow avalanching, and rockfall. Reworked glacial sediments in colluvium occur within the limits of past glaciations*

Cb — ***Colluvial blanket sediments:*** *Diamicton, stony, massive, 1 to 2 m thick*

Cv — ***Colluvial veneer sediments:*** *Diamicton, stony, massive, <1 m thick or patchy; overlies bedrock*

Ca — ***Colluvial apron sediments:*** *Bouldery diamicton and poorly sorted and stratified sand and gravel; sediments form a wedge-shaped slope-toe complex of small steep debris flow and avalanche-dominated fans and solifluction deposits derived from bedrock or glacial debris up slope; thickness ranges from <1 m at the up slope limit to up to 10 m in the thickest part of the apron*

Cc — ***Rockfall sediments:*** *Bouldery rockfall deposits; forms cone-shaped landforms at the angle of repose below steep bedrock slopes; thickness ranges from <1 m at the margin to 10 m near the midpoint of the cone*

Ch — ***Landslide sediments:*** *Diamicton formed of broken rock, soil, and glacial deposits; forms a hummocky or ridged topography with ridges transverse to direction of movement; thickness variable, may range up to 10 m (direction of movement indicated by symbol)*

Cx — ***Undivided colluvial sediments:*** *Hummocky apron terrain adjacent to mountainous uplands, possibly of mass wasting origin*

ALLUVIAL SEDIMENTS: *Gravel to silt size sediments deposited by streams either within channels or as overbank deposits. Deposits are commonly stratified and moderately to well sorted, with the exception of some alluvial fan deposits*

Ap — ***Alluvial plain sediments:*** *Gravel and sand, massive to stratified, moderately to well sorted; locally overlain by or includes lacustrine silt and clay and minor peat and organic silt deposited in abandoned channels and along floodplain margins; forms plains within about 1 m of present stream level which are subject to inundation during floods; thickness 1 to 5 m*

At — ***Alluvial terrace sediments:*** *Gravel and sand, massive to stratified, moderately to well sorted; sediments are of floodplain origin now isolated from flooding by stream incision; thickness ranges from a discontinuous covering on bedrock to several metres; where alluvial terraces are cut into glaciofluvial plains, total thicknesses of gravel and sand may be 5 m or more*

Af — ***Alluvial fan sediments:*** *Gravel and gravelly diamicton, stratified, poorly to moderately sorted; forms fan-shaped landforms where streams enter larger valleys; in mountainous terrain, alluvial fans may be subject to inundation of debris flows; thickness up to 10 m*

Ax — ***Alluvial complex sediments:*** *Floodplains, fans, and terraces that cannot be subdivided at the scale of mapping*

WISCONSINAN - Erratics Train Glaciation
Sediments deposited during advances and retreats of glaciers from Rocky Mountains and continental interior

GLACIOLACUSTRINE DEPOSITS: *Well stratified sand, silt, and clay deposited in lakes dammed by glacial ice. Where deposition was distant from ice margins, glaciolacustrine sediments underlie plains or gently rolling terrain. Where deposition was near ice, they may underlie ridged, hummocky, or pitted terrain caused by subsequent ice meltout. May include some postglacial lacustrine sediments*

Lv — ***Glaciolacustrine veneer sediments:*** *Silt, clay, and fine sand, well stratified, thinly bedded to laminated or discontinuous; thickness <1 m thick to discontinuous*

Lb — ***Glaciolacustrine blanket sediments:*** *Silt, clay, and fine sand; surface morphology conforms to underlying topography*

Ll — ***Glaciolacustrine plain sediments, local relief <1 m:*** *Silt, clay, and fine sand, thinly bedded to laminated; surface morphology is a plain and underlying topography is generally obscured by these sediments; thickness 1 to 20 m*

Lp — ***Rolling glaciolacustrine plain sediments, local relief 1-2 m:*** *Fine sand, silt, and clay, thinly to massively bedded; surface morphology undulating; underlying topography is generally obscured by these sediments; thickness 1 to 20 m*

Lh — ***Ice-contact glaciolacustrine complex sediments:*** *Predominantly silt and sand; gravel, diamicton lenses and dropstones may comprise up to 10% or more of this unit; bedding thin to massive; bedding is commonly deformed due to syndepositional slumping and ice meltout; surface morphology is hummocky, pitted, and ridged with relief up to 10 m; commonly underlain by hummocky moraine sediments; thickness 5 to 10 m*

GLACIOFLUVIAL SEDIMENTS: *Sand, gravel, and minor silt and diamicton deposited by streams flowing away from, or in contact with glacial ice. Sorting ranges from good to poor and stratification from thinly bedded to massive. Sediments may display evidence of syndepositional collapse due to meltout of buried or supporting ice. In areas formerly covered by glaciers from the Rocky Mountains only, lithologies include Precambrian and Paleozoic limestone, dolostone, argillite, and quartzite, and may include mafic and felsic volcanic rocks in the Oldman River basin. In areas covered by montane glaciers and glacier ice from the continental interior, additional lithologies include sandstone, mudstone, conglomerate and Canadian Shield provenance granitic and metamorphic lithologies*

Gp — ***Glaciofluvial plain and fan sediments:*** *Gravel and sand; massive to thickly bedded; former outwash plains and fans; thickness 1 to 10 m*

Gt — ***Terraced glaciofluvial sediments:*** *Gravel and sand; massive to thick bedded; former outwash plains and fans incised into a succession of terraces; thickness 1 to 10 m*

Gd — ***Glaciofluvial delta sediments:*** *Sand, gravel, and minor silt and clay; thinly bedded to massive; flat surfaced, delta-form in plan view; deposited as a delta along the margin of a former glacial lake; thickness from 5 to 10 m*

Gh — ***Glaciofluvial ice stagnation complex sediments:*** *Sand, gravel, diamicton, and minor silt and clay, thinly bedded to massive; bedding is commonly contorted and folded due to syndepositional ice meltout; surface morphology includes hummocks, kettle, esker and crevasse-fill ridges 2 to 10 m in relief with minor elements of unit Gp and Gt; thickness 5 to 10 m*

Gx — ***Undivided glaciofluvial and ground moraine sediments:*** *A patchwork of glaciofluvial sediments and ground moraine (till) too variable to resolve at the scale of mapping*

Gv — ***Glaciofluvial veneer sediments:*** *Gravel and sand, massive to thickly bedded; thickness <1 m or patchy; overlies bedrock*

MORAINAL SEDIMENTS (till): *Diamicton (pebble to boulder size clasts suspended in a poorly sorted clay to sand size matrix) deposited directly by glacial ice; redeposition, where it has occurred, has been by sediment gravity flow and/or ductile deformation. Tills of two provenances were deposited during the Erratics Train Glaciation: T^C contains clasts of Rocky Front and Main ranges Precambrian and Paleozoic limestone, dolostone, and quartzite; Foothills and Interior Plains Mesozoic and lower Tertiary sandstone, mudstone, and coal; as well as Canadian Shield provenance granitic and metamorphic rocks. T^C contains Rocky Mountain Precambrian and Paleozoic limestone, dolostone, argillite, and quartzite (may include Precambrian igneous rocks south of Crowsnest River); and Foothills Mesozoic and lower Tertiary sandstone, shale, and coal (includes lower Cretaceous volcanics in the Crowsnest Pass area). Trace amounts of Canadian Shield provenance clasts are present only where montane ice overran pre-existing drift containing Canadian Shield provenance clasts*

Tv^C Tv^M — ***Till veneer:*** *<1 m thick or discontinuous diamicton with patches of exposed bedrock or colluvium. Tv^C generally contains more and coarser pebble and larger clasts than does Tv^I and both may contain extensive areas of thin (<1 m) and patchy colluvium; overlies bedrock*

Tb^C Tb^M — ***Till blanket:*** *1 to 5 m of diamicton that conforms to the underlying bedrock topography. Tb^C generally contains more and coarser pebble and larger clasts than does Tb^I*

Th^C Th^M — ***Hummocky moraine:*** *Diamicton and interstratified glaciofluvial gravel and sand, massive to thick bedded, bedding slumped, faulted, and folded by syndepositional ice meltout, may contain variable amounts of ice-walled lake fine sand and silt; forms hummocky, kame and kettle topography; local relief up to 30 m; thickness may be tens of metres*

Tm^C Tm^M — ***Rolling till plain:*** *More than 5 m of diamicton; surface morphology undulates with 1-2 m local relief; totally or largely obscure surface morphology of underlying bedrock*

EARLY PLEISTOCENE OR PLIOCENE GLACIAL OR NONGLACIAL SEDIMENTS

Tb^M — ***Till? blanket:*** *Stony diamicton cemented to a calcrete; contains striated clasts; thickness 2 to 3 m; rests on a succession of similar sediments of glacial or nonglacial origin*

PALEOZOIC TO EARLY TERTIARY ROCK

R — *Sandstone, siltstone, shale, mudstone, conglomerate, coal, and minor volcanic rocks of early Tertiary and Mesozoic age and limestone, dolostone, and quartzite of Paleozoic and Precambrian age (includes areas of thin colluvial cover, blockfields, sorted stone polygons in alpine areas)*

R-A — *Areas of rock as above subject to rapid mass wasting processes (rockfall and snow avalanches)*

R-G — *Upper Mesozoic and Early Tertiary rock eroded into badland topography*

VENEER

Glaciolacustrine

Eolian

Geological boundary (defined, assumed, inferred)
Neoglacial lateral or end moraine
Arête
Cirque
Meltwater channel:
large
small (flow direction known, unknown)
edge of ice-walled channel
Esker (flow direction defined, undefined)
Landform streamlined by glacial ice (direction of flow known, unknown)
Ice limit (defined, assumed, inferred):
M1 *Maximum ice limit of Late Wisconsinan montane glacial ice*
M2 *Ice limit of first major readvance of Late Wisconsinan montane glacial ice*
C1 *Maximum ice limit of Late Wisconsinan continental glacial ice*
C2 *Readvance position of Late Wisconsinan continental glacial ice*
Lateral and end moraine (associated with advance M1, M2, or retreat of continental ice sheet from limit C2)
Former ice contact face in stratified drift
Stratigraphic section
Vertebrate fossil locality
Radiocarbon age (years before present) — 10600±100 GSC 2182
One or more Foothills Erratics Train Erratic >1 m in length
*Cosmogenic ^{36}Cl exposure age on Foothills erratic (years before present)** — 15000±400
Montane erratic close to or at the all time upper limit of montane glaciation
Canadian Shield erratic at or near the all time upper limit of continental glaciation
*Cosmogenic ^{36}Cl exposure age of Canadian Shield erratic at or near the all time upper limit of continental glaciation (years before present)** — 22500±1200
Arrows indicating direction of landslide movement (associated with the unit Ch)

** Assumes a zero erosion rate and no cosmic ray blockage by snow cover*
