

LEGEND table with columns for geological units and their descriptions. Includes Paleozoic, Proterozoic, and Archean units.

National Geochemical Reconnaissance Central Baffin Island Project Lake Sediment and Water Sample Locations for Open File 3716

INTRODUCTION
Large areas of Canada have been covered by stream and lake surveys carried out under the National Geochemical Reconnaissance (NGR) program. The goal of this program is to establish and maintain a nationally consistent database of field and analytical data derived from drainage sediment and water samples. Toward this end, systematic surveys have been conducted since 1975. To date (1999), more than 200 surveys have been completed to NGR standards, representing over 150 000 sites covering 2.3 million km² throughout Canada (see Figure below). These were carried out mainly by the Geological Survey of Canada, either independently or in cooperation with provinces and territories, under various funding arrangements.
