1988b: Morphological changes at the dune restoration sites; in *Terrain Management Activities, Sable Island*, (ed.) R. B. Taylor; Geological Survey of Canada, Open File 1973, p. 33-95.

Taylor, R. B., Wittmann, S. L., Milne, M. J., and Kober, S. M.

1985: Beach morphology and coastal changes at selected sites, mainland Nova Scotia; Geological Survey of Canada, Paper 85-12, 95 p.

profond. Cependant, à des profondeurs d'eau de 30 à 40 m, des vagues de sable de 10 à 15 m de hauteur recouvrent un vaste placage de sable et de gravier (fig. 13 et 15; Miller et Fader, 1990). De plus, des données de sismique-réflexion indiquent qu'au moins de 20 à 30 m de sédiments stratifiés du Quaternaire tardif recouvrent une unité non stratifiée, qui serait composée de sédiments de contact glaciaire reposant sur le substratum rocheux (fig. 15).

REMERCIEMENTS

Les auteurs tiennent à remercier D. Frobé et d'autres collègues pour leur précieuse aide sur le terrain, S. Heming pour sa participation à la compilation, G. Fader et R. Miller pour leur avoir transmis les levés non publiés sur le champ de vagues de sable de la baie de Scots et H. Josenhans et G. Sonnichsen pour leurs critiques judicieuses de la carte.
