## GEOPHYSICAL PAPERS

In 1948, the Geological Survey of Canada published the first of a series of maps presenting the results of magnetic geophysical surveys. These maps aid in the interpretation of geological structures and of the geology under drift-covered areas, and also direct the attention of prospectors and exploration organizations to anomalies that may have economic significance. The magnetic information is presented as isomagnetic contours on blue-line prints. The magnetic contours on maps Nos. 1 to 6 inclusive are based on the results of ground magnetic surveys and the contours on aeromagnetic maps are from surveys made with an airborne magnetometer.

Maps covering the following areas were issued prior to the end of 1950:

WATER SUPPLY PAPERS

An adequate supply of potable water in many areas of Canada, especially in the Prairie Provinces, became a serious problem after 1932. To provide geological information as a guide in locating new supplies of water large areas were surveyed, and by the end of 1950 the Geological Survey of Canada had prepared 306 reports. Copies of many of these reports were supplied directly to the municipalities concerned; many of the reports are out of print, but all are available for consultation in the library of the Geological Survey of Canada, Ottawa.

The following is a list of the reports arranged by provinces either geographically or alphabetically:
