**INTRODUCTION**  
This sheet of nine maps is one of three of similar format provided in this Open File. Grouped together are elements of certain affluents and/or similar distribution patterns. The three areas are listed:

- 1) Base Metals, Silver and Pathfinder Elements (Open File 3594a)
- 2) Metal Sulfide Elements with Thorium and Lanthanum (Open File 3594b)
- 3) Alkali Metals, Alkaline Earths, Manganese and Aluminium (Open File 3594c)

The elements depicted on these sheets are either those that show moderate geochemical data relative to the survey area, or they are representative of a closely associated suite of elements (e.g. of the rare-earth elements, only La is shown because the distribution patterns of the other 7 determined [Ce, Eu, Lu, Nd, Sm, Tb, Yb] are almost identical). Full data listings of concentrations of these and other elements in each sample are supplied in the diskette issued as Open File D3594d. The diskette includes, also, a more detailed description of the methodology, analytical methods and analytical quality control.

**RATIONAL FOR BIOGEOCHEMICAL SURVEYS**  
The roots of a single large tree extract elements from many cubic metres of soil, overburden, groundwater and sometimes bedrock. These elements are then transferred to aerial parts of the tree where they may become locally concentrated. In a multidisciplinary survey program, they may be derived from the analysis of an appropriate vegetation sample medium permits geochemical mapping, with enhanced background to anomaly contrast of certain elements, which may be in mapping bedrock and in the search for concealed zones of mineralization.

Because each species of plant has a different requirement for, and tolerance to, a range of chemical elements, some partitioning of elements takes place and there is selective absorption and translocation into the plants. For biogeochemical exploration, conifers provide suitable and effective sample media because they are primitive plants that have a wide tolerance to many trace elements. The outer bark is a repository for many elements that are not required for the metabolic function of the tree.

The geochemical information supplied by the vegetation is different from that of the soil. Just as two methods of geochemical survey may provide totally different information, so may two methods of geochemical survey. A high correlation between distribution patterns of two geochemical sample media is the exception rather than the rule. In geological environments where there is sufficient concentration of metals to form a mineral deposit, such a 'critical mass' of elements may be sufficient to generate biogeochemical anomalies above the mineral level (e.g. by groundwater movement or movement in electrochemical cells). This, however, usually have

**DESCRIPTIVE NOTES**  
geochemical anomalies displaced down-ice from a mineralized zone. Such factors need to be taken into consideration when interpreting geochemical results.

**RECONNAISSANCE SURVEY**  
Lodgepole pine is the most common tree species in the Nechako area, and many metals concentrate in its outer bark. Hence, pine bark was selected as the sample medium for a reconnaissance-level biogeochemical survey in the Nechako project area. Samples were obtained by scoring approximately 100 g of outer bark from around the circumference of mature trees. The preferred sample interval was 2 km along roads, trails, and tracks. To minimize the effects of airborne contamination from other trees, samples were collected at a distance of at least 50 m into the forest. In addition, through-cut samples were collected by Alan Proulx (GSC) and his assistants at sites close to where they obtained fill samples. Because of the lack of roads and trails in some areas, the sampling grid is not even. However, on average the sample coverage is approximately 1 site per 8 km<sup>2</sup>, and data from the analysis of 229 samples are used for the completion of this Open File.

Bark samples were returned to the GSC laboratories in Ottawa where they were air-dried then reduced to ash by controlled ignition at 450°C for 24 hours. Ash samples were submitted for the analysis of 36 elements by instrumental neutron activation (INAA) and 36 elements by inductively coupled plasma emission spectrometry (ICP-ES) at Activon Laboratories Ltd. (Vancouver, BC). The INAA analysis reports the total concentration of elements in the sample. The ICP-ES is performed on an aqueous digest of the ashes, and provides data on the total or near total concentrations of most elements. Data for some elements are obtained by both methods, but after review of the data from a quality control standpoint only the more accurate and precise set of values is recorded in the data listing.

**MAP PRODUCTION AND DATA PRESENTATION**  
The proportional data maps are plotted using the Universal Transverse Mercator projection (NAD27 datum), with a central meridian of 124°30' (Zone 10). They were generated using ARC/INFO (ArcView, ESRI) and ArcMap (ESRI) software. The maps, with their corresponding report, promote the user to report precise break points and an appropriate scaling exponent for each element to be mapped. Proportional dots are then generated, using the ARCSIN, SPOTSIZE, POINTSIZE and SPOT commands, with the user specifying an appropriate minimum and maximum dot size. Exponents for individual elements were determined by trial and error to provide the best view of the analytical data. Accordingly, care should be exercised when attempting to compare different elements plotted with different exponents. Comments on distribution patterns are given in the digital file on the diskette sold separately as Open File D3594d.

QUATERNARY	STRATIFIED ROCKS	INTRUSIVE ROCKS	WITH PHASE
Q	Platocene glaciofluvial and glaciolacustrine sediments; Holocene alluvium	ECENE(?)	LJFN Grey to pinkish-brown, unfoliated, medium-grained, equigranular to K-feldspar megacrystic biotite monzogranite (ca. 168-158 Ma)
MIOCENE	CHILCOTIN GROUP	EC	Medium pink and white, unfoliated, fine- to medium-grained biotite monzogranite; minor hornblende-plagioclase porphyry (Ech); intrusive crystal tuft and breccia (Ech) and fine grained gabbro (Egq)
MC	Olivine basalt, columnar	EVeh	White micritic leucogranite (Ei) and hornblende-plagioclase porphyry (Eih); alkali feldspar porphyry (Eip)
EOCENE	ENDAO GROUP	NSZ	Ductile deformed Frank Lake Pluton and Brooks Diorite Complex
EE	Brownish-grey amphibolite, (siliceous-) pyroxene- and plagioclase-phryic basalt and basaltic andesite flow, hyaloclastite and volcanoclastic rocks; minor sandstone	ERL	Black, granodiorite, granite
EOL	Ootsa Lake Group	EgB	Gabbro, diabase
Egr	White to pinkish-brown rhyolite, dacite, and basal brown andesite flow; pyroclastic and volcanoclastic rocks	EiH	Hornblende-plagioclase porphyry
Eg	White to pinkish-brown rhyolite, dacite, and basal brown andesite flow; pyroclastic and volcanoclastic rocks	KEI	Greenish grey, andesite (oligoclase) hornblende-plagioclase porphyry and diorite
UPPER CRETACEOUS	UPPER CRETACEOUS	KHic	Reddish-brown hornblende-plagioclase porphyry (KHic); Cabin Lake pluton; homogeneous, fine to medium-grained, (hornblende) biotite quartz monzonite
JKV	Porphyritic, intermediate and felsic volcanic flow and tuffaceous rocks, arkose, dacite, crystal-rich tuff, and andesite to dacite hornblende-plagioclase-phryic tuff and breccia	MID-CRETACEOUS OR EOCENE(?)	mK Mottled pink and white, fine to medium-grained, felsic granite; rock, unfoliated; Cabin Lake pluton (sawtooth) biotite quartz monzonite (mK)
JURASSIC OR CRETACEOUS	ROMBER LAKE OR SKEDNA GROUP	LATE JURASSIC	CASEY PHASE
mJL/RK	Tuff to green gabbro conglomerate and hornblende- and plagioclase-bearing sandstone	LJFC	Granite, granodiorite
mJL/B	Rusty to black siltstone and chert-rich sandstone and conglomerate	LJFE	Biotite ± hornblende granite to granodiorite
mJL/H	Greenish grey oligoclase-phryic basalt, breccia, argillite, and volcanoclastic rocks	LJFI	Biotite granite to granodiorite
mJL/S	Unfoliated maroon-grey helvolitic and monolithic breccia, and tuffaceous gnl, sandstone, and mudstone	LJFL	Mottled pink and white, unfoliated, fine- to medium-grained biotite monzogranite
mJL/T	Maroon and green, helvolitic fine- to coarse-grained volcanoclastic and epiclastic volcanic rocks; minor associated porphyry	FRANCIS SUBPHASE	
mJL/U	Andesite, rhyolite, basalt, dacite, crystal tuff, flow and breccia; related intrusive rocks, monzonite, monodiorite, andesite-feldspar porphyry	LJFJ	Biotite granite to granodiorite
mJL/V	Andesite, rhyolite, basalt, dacite, crystal tuff, flow and breccia; related intrusive rocks, monzonite, monodiorite, andesite-feldspar porphyry	LJFK	Biotite granite to granodiorite
VANDERHOOF METAMORPHIC COMPLEX (Jva - Jvb)	Jvb		
Jva	Amphibolite, calc-silicate veins, local diorite dykes and sills
