

- LEGEND**
- This legend is common to Open Files 1598 to 1613, and 1628 to 1631.
Coloured legend blocks indicate map units that appear on this map.
Not all map symbols shown in the legend necessarily appear on this map.
- SURFICIAL DEPOSITS**
- QUATERNARY**
- HOLOCENE**
- FLUVIAL SEDIMENTS:** alluvium; gravel and sand, 2–20 m thick.
- Ap Alluvial plains: active braided floodplains; includes active proglacial outwash.
 - At Alluvial terraces
 - Al Alluvial fans
- MARINE AND GLACIAL MARINE SEDIMENTS:** gravel, sand, silt, and clay, 1–20 m thick; deposited in deltaic and beach environments during regression of the postglacial sea.
- Mr Beach sediments: gravel and sand, 1–5 m thick, forming ridges and awales.
 - Mt Deltaic sediments: clay, silt, sand, and gravel, 5–20 m thick, forming coarsening upward sequences under dissected terraces.
 - Mv Deepwater proglacial silt veneers: silt, clay silt, and fine sand with dropstones, 1–2 m thick.
 - Mb Deepwater proglacial silt blankets: clay, silt, sand, and fine sand with dropstones and minor gravel, 2–10 m thick.
- GLACIAL LACUSTRINE SEDIMENTS:** clay, silt, sand, and gravel deposited in glacier dammed lakes in deepwater, beach and deltaic environments.
- Lr Beach sediments: sand and gravel, 1–5 m thick, forming beach ridges.
 - Lt Deltaic sediments: clay, silt, sand, and gravel, 5–20 m thick, forming coarsening upward sequences under dissected terraces.
 - Lv Deepwater proglacial silt veneers: silt, clay silt, and fine sand with dropstones, 1–2 m thick.
 - Lb Deepwater proglacial silt blankets: clay, silt, sand, and fine sand with dropstones, 2–5 m thick.
- GLACIOFLUVIAL SEDIMENTS:** gravel and sand, 1–10 m thick, deposited behind, at, and in front of the ice margin.
- Gp, Lt Proglacial outwash: gravel and sand, 1–10 m thick, forming braided floodplains, Gp; terraces, Lt; and fans, Gt.
 - Gr, h Ice contact stratified drift: gravel and sand, 1–5 m thick, forming eskers, Gr; and kames, Gh.
- EARLY HOLOCENE AND WISCONSINAN**
- TILL:** nonsorted stony muds, 0.5–60 m thick, deposited in subglacial and ice marginal environments; lithic composition generally reflects underlying bedrock.
- Tm End moraine: 5–80 m high, composed of or mantled by till, extensively kettled in places; large features mainly covered by debris-rich relict glacier ice.
 - Tv Till veneer: 0.5–2 m thick and discontinuous.
 - Twv Till veneer: 0.5–2 m thick, surface armoured by stones due to washing by subglacial meltwater.
 - Tb Till blanket: 2–10 m thick forming an undulating blanket with drumlins and ribbed moraines in places.
 - Tbr Till blanket: 2–10 m thick forming ribbed (Rogen) moraines.
- BEDROCK**
- PRE-QUATERNARY**
- R ROCK: rock of various compositions and ages (Jackson and Sangster, 1987) variably modified by glacial erosion during the Quaternary and with patchy till cover; hilly and hummocky surfaces, ice moulded in places, with lake basins in subglacially scoured regions; smooth surfaces exhibiting little or no sign of glacial erosion in peninsular interiors (Dyke, 1983); cliffs resulting from glacial over-steepening in places veneered by thin till, commonly bouldery.
- Geological boundary (defined, assumed)
Areas covered by perennial icefields during the Little Ice Age (indicated by a white pattern)
Kettle (large)
Glacial lake spillway
Glacial lake limit
Marine limit
Escarpment
Lateral meltwater channel; barbs on upslope side
Subglacial and proglacial meltwater channel (small)
Esker
Kame
Ice contact face
Ribbed moraine
Lateral moraine
End moraine
Margin of dispersal train; teeth toward axis, steep side of teeth face down ice
Drumlinoid hill
Crag-and-tail
Ice moulded bedrock
Striae (ice flow direction known, unknown)
Crossed striae (numbers indicate relative age, 1 being the oldest)
Field observation site: bouldery diamiction (bd), bouldery gravel (bg), clay (c), diamiction (di), gravel (g), gravelly sand (gs), mud (m), muddy sand (ms), rock (r), sand (s), sandy gravel (sg), stony mud (sm), till (t)
Field observation site: material as above near rock outcrop
Marine limit elevation (metres) 1 88

would be welcomed by the Geological Survey of Canada

Digital base map from data compiled by Geomatics Canada, modified by ESS Info

Locational accuracy of the base appears to be ±100m based on
plotting of GPS measured field site locations
Proximity to the North Magnetic Pole causes the magnetic compass to be erratic in this area
Mean magnetic declination 2003, 41°28'W, decreasing 42.8' annually

Elevations in metres above mean sea level
