

NOTES

1. The lateral contact of the "Parrish Glacier beds" and "oolitic beds" of the Cass Fjord Formation is an extended facies change on both sides of Radmore Harbour. The contact indicated on the map is arbitrary.
2. The Ritter Bay Formation consists of major interfingering units of shale and sandstone. The upper contact of the formation and of the Archer Fiord member are diachronous.
3. An account of the geology of Hans Island has been prepared separately (Harrison et al., in press)
