Digital base map from Terrain Resource Information (TRIM), modified by DDD

Shaded relief image prepared by DDD, derived from the digital elevation model, based on TRIM contours elevation data

Illumination: azimuth 315°, altitude 45°, vertical factor 1x

Magnetic declination 2008, 18°08' E, decreasing 12.6' annually. Elevations in metres above mean sea level

Contour interval 20 m

Glacier: A mass of ice formed from compacted snow in an area where snow

NONGLACIAL ENVIRONMENT ANTHROPOGENIC DEPOSITS: rubble, diamicton, and gravel; 1 to 10 m thick; forming flat and steep surfaces; emplaced by human activity.

LEGEND

accumulation exceeds melting and sublimation.

SURFICIAL GEOLOGY QUATERNARY

POST-FRASER GLACIATION

river level; prone to flooding.

avalanche track.

ORGANIC DEPOSITS: peat and muck; 1 to 10 m thick (typically 2 to 3 m); forming fens and bogs; organic deposits too small to be shown at this scale occur within other units; common within abandoned meltwater channels. ALLUVIAL (FLUVIAL) DEPOSITS: gravel and sand with minor silt and clay, deposited

by streams; commonly stratified; generally well sorted except in alluvial fans. Floodplain sediments: sand and silt, commonly including organic materials and underlain, in many places, by gravel; 1 to 3 m thick; occurring as flat surfaces close to

Terrace sediments: stratified sand and gravel overlain by a veneer of sand and silt; 2 to 10 m thick; forming terraces well above flood level.

Deltaic sediments: stratified sand and gravel underlain by silt and clay; generally 2 to 15 m thick; occurring at the mouths of streams entering lakes.

thick; forming fans at the toe of slopes; Af-Cf alluvial fan associated with the Cheekye COLLUVIAL DEPOSITS: diamicton and rubble deposited by various mass-wasting processes, ranging from slope wash to rock fall; composition dependent on source

Fan sediments: poorly sorted sand and gravel, with diamicton; generally 2 to 15 m

Landslide debris: mostly unconsolidated sediments, with texture dependent on source materials; generally 1 to 10 m thick, but may exceed 10 m near the toe of large landslides; forming hummocky accumulations on lower slopes and valley floor. Where possible, landslides were identified by type: Ch-df, debris flow deposit; Ch-da, debris avalanche; Ch-ds, debris slide; Ch-rs, rock slide; Ch-ra, rock avalanche; Ch-sa, snow

Slope colluvium: rock fragments in a matrix of, boulders, gravel, sand, silt, and minor clay; 1 to 10 m thick; formed by bedrock weathering or reworking of unconsolidated deposits on steep (>30°) slopes; commonly gullied.

Talus: rubble and block accumulations at the bottom of steep (>40°) slopes;

Colluvial veneer: rock fragments in a matrix of boulders, gravel, sand, silt; usually <3 m thick; formed by bedrock weathering or reworking of unconsolidated deposits.

FRASER GLACIATION (LATE WISCONSINAN) PROGLACIAL AND GLACIAL ENVIRONMENT

1 to 10 m thick; forming aprons and cones.

GLACIOMARINE DEPOSITS: sand and gravel, well to poorly sorted, and commonly stratified; deposited by glacial meltwater; bedding disrupted locally due to melt of

Glaciomarine terrace sediments: sand and gravel, stratified to massive; 1 to 10 m thick; forming flat surfaces perched well above alluvial deposits or associated with meltwater channels, may be fossiliferous.

GLACIOFLUVIAL DEPOSITS: sand and gravel, well to poorly sorted, and commonly stratified; deposited by glacial meltwater; bedding disrupted locally following the melting of supporting ice. Ice-contact deposits: sand and gravel, stratified to massive and commonly faulted; generally >3 m thick; forming hummocky surfaces. Gh-Cf is an ice-contact debris flow complex associated with the Cheekye fan which differs geomorphologically and

Glaciofluvial terrace sediments: sand and gravel, stratified to massive; 1 to 10 m thick; forming flat surfaces perched well above alluvial deposits or associated with

Glaciofluvial blanket: sand and gravel, stratified to massive; generally 1 to 10 m thick; sediment cover is continuous, but the underlying morphology is visible; commonly located near the mouth of meltwater channels.

commonly overlying glaciolacustrine silt and clay; forming, in part, slightly inclined Glaciofluvial veneer: sand and gravel, well to poorly sorted, and commonly stratified;

supporting ice, 1 to 3 m thick.

on steep slopes.

deposited by glacial meltwater; bedding disrupted locally following melting of

GLACIAL ENVIRONMENT TILL: Poorly sorted diamicton consisting of pebbles, cobbles, and boulders in a sandy to clayey matrix, directly deposited by glaciers; includes colluvium (reworked till) on

steep slopes, and small units of glaciofluvial sediments, especially in valley bottoms and near the mouths and banks of meltwater channels; till surface is commonly rilled

Proglacial deltaic sediments: sand and gravel with minor silt and clay; 5 to 10 m thick;

Till blanket: continuous till cover with few bedrock outcrops; 1 to 3 m thick on average; conforming to and may be locally obscuring morphology of underlying units.

Till veneer: discontinuous till cover with abundant bedrock outcrops; 1 m thick on average; reflecting topography of underlying bedrock.

PRE-QUATERNARY

123°00'

BEDROCK: sedimentary, low-grade metamorphic, volcanic, and intrusive rocks of Jurassic to Quaternary age; including, in places, till veneer, drift, and colluvium.

Geological boundary (defined, inferred)
Limit of mapping
Ice-contact scarp
Escarpment
Large meltwater channel
Small meltwater channel
Sand and gravel pit (large, small)
Travel directions of landslides, mainly debris flows and snow avalanches
Crest

ACKNOWLEDGEMENTS

This mapping project was funded by Climate Change Action Fund A769A. The author wishes to thank R. Schwartz and P. Kertland of CCAF for financial and managerial guidance of the project. The author is grateful to T. Millard and M. Geertsema from BC Ministry of Forests and Range for providing digital TRIM data as well as helpful discussions. J. Clague, O. Hungr, and F. Baumann provided invaluable critical reviews. K. Shimmamura, S. Denny, M. Ulmi, C. Hickson, N. Jordan, F. Baumann, M. Journeay, B. Harmanna, C. and R. Strijk, provided field and/or tophrical assistance. B. Fournier R. Hermanns, C. and B. Struik provided field and/or technical assistance. R. Fournier, M. Boutin, F. Créach'cadec, and S. Paradis gave GIS assistance for parts of the map area. M. Méthot and N. Côté are thanked for their assistance in GIS and creating the final map product. Many thanks go to my GSC colleagues for helpful discussions and advice throughout the project.
