

This is a common map legend for the surficial geology of northern Alberta. Coloured legend blocks indicate map units that appear on

PREGLACIAL FLUVIAL DEPOSITS: Sediments transported and deposited by streams and rivers prior to

fans and deltas); ranging from late Tertiary to middle Wisconsin.

Cordilleran source, Paleogene (Tertiary) to early Quaternary.

glaciation. Includes sand and gravel deposits occurring in paleovalleys (i.e., preglacial floodplains, terraces,

UNCONSOLIDATED FLUVIAL GRAVELS: Predominately well-sorted, quartzite and chert gravel and cobbles;

BEDROCK: Undifferentiated; may include clastic sedimentary rock, shale, carbonate and crystalline (Shield),

### Index to adjacent areas

Unimproved road

UTM, Zone 11 Grid

Contour, intervals 10 metres

# from glaciolacustrine delta, or 'FGIk-MSh' indicating ice-contact kame and kettle topography that blends with hummocky stagnant ice moraine.

Morphologic Overprint

Where a sequence of geomorphic processes has produced a multi-aspect or compound terrain fabric, the geomorphic modifier suffixes are appended in the inferred order of superposition. 'Mpry' means a plain of till has been moulded into ridge forms and finally dissected by modern streams. 'FGphr' means a glaciofluvial plain has been discontinuously

'Mv/LGv/FGp' means at least 60% of the area is underlain by morainal veneer, with up to 40%

Where materials of different origins or textures are known to be superimposed or can be confidently

inferred, the sequence is indicated in conventional order using vertical separators, such as:

'sLGv | Mp' Thin sandy glaciolacustrine sediment deposited on morainal plain

'LGp//M' means more than 60% of the area is underlain by a glaciolacustrine plain, with less than 15% moraine.

Locally, two or more terrain units are juxtaposed by reason of related origin, temporal sequence or ambiguous geomorphic distinction. In the last case, both components may be present. Such situations are identified by a

compound designation marked by a hyphen. Examples: 'FGz-LGz' indicating ice-contact delta indistinguishable

glaciolacustrine veneer and less than 15% glaciofluvial plain.

### covered by ice-contact hummocks and ridges.

Acknowledgements

glaciolacustrine veneer.

Stratigraphic Sequence

Transitional Association

Surficial mapping was completed from 2005 to 2006 as an Alberta Geological Survey (AGS) and Geological Survey of Canada (GSC) collaborative contribution to NRD Project 4450 and the Quaternary mapping initiative under the Alberta Mineral Strategy. N. Atkinson, S. Botterill, H. Campbell, and K. Dlussky assisted with fieldwork. Digital cartography and GIS were completed by K. Mckay and GISmo Solutions Ltd. Base data provided by Spatial Data Warehouse Ltd. L. Dredge (GSC Ottawa) and N. Atkinson (AGS) provided constructive comments that improved this map.
