OF6013

peat and muck, occurring as flat to gently sloping plains

FENLAND: woody sedge peat; 1-2 m thick

PEATLAND: sphagnum peat generally underlain by woody sedge peat; 0.5-2 m thick

PEATLAND (> 50%) AND FENLAND

FENLAND (> 50%) AND PEATLAND

sand, silt and minor gravel in association with modern drainage regime ALLUVIAL PLAIN: coarse sand and gravel with silt, fine sand and some organic detritus, occurring as channel and overbank floodplain sediments or in-channel bars;

ALLUVIAL FAN: mainly sand and silt with minor gravel and discontinuous layers of peat occurring as fan deposits

ALLUVIAL COMPLEX: floodplain and fan deposits; may contain small areas of

Colluvial and landslide deposits diamicton and rubble derived from bedrock and/or surficial material through a variety of colluvial and landslide processes

COLLUVIAL COMPLEX: slope complex consisting of diamicton and rubble; may include minor landslides (Cz) and/or alluvial fan (Af) units; > 2 m thick

LANDSLIDE: bedrock, rubble and/or diamicton occurring as stepped or tongue-shaped deposits; formed by rotational slumping, retrogressive thaw flow, debris flows, rock topple and translational slides in surficial sediments and/or bedrock; they are prominent along former meltwater channels

Late Pleistocene **Eolian deposits** fine to medium sand, minor silt derived from deltaic or glaciolacustrine deposits in

association with deglacial wind direction EOLIAN VENEER: discontinuous cover of mainly fine sand and silt over other surficial units and bedrock; < 1 m thick

EOLIAN VENEER TO BLANKET: discontinuous cover (veneer dominant) of mainly fine sand and silt over surficial materials, most commonly till, lacustrine and or glaciofluvial deposits; <1-10 m thick

PARABOLIC DUNES: sand; < 15 m thick

eolian sand; 2-15 m thick

EOLIAN COMPLEX: veneer to blanket deposited over other surficial materials particularly lacustrine and till plains; includes parabolic dunes

silt and clay with minor sand and diamicton; sediments deposited in a proglacial lake LACUSTRINE PLAIN: flat to gently sloping cover; locally overlain by eolian sand; 1-10

LACUSTRINE PLAIN WITH THERMOKARST DEPRESSIONS: flat to gently sloping

cover; locally overlain by eolian sand; 1-10 m thick LACUSTRINE BLANKET: deposit conforms to local topography up to 8 m of relief;

locally overlain by eolian sand; 2-10 m thick LACUSTRINE VENEER: discontinous deposits, conforming to local topography; commonly associated with small lakes following ice retreat; locally overlain by eolian

LACUSTRINE PLAIN, ROLLING: rolling, occurring as low ridges; locally overlain by

SHORELINE DEPOSITS: low, ridged beach deposits of sand and gravel; < 5 m thick

LACUSTRINE COMPLEX: deltaic sediments transitional between glaciofluvial and

glaciolacustrine deposits with upper 0-5 m consisting of sand; locally overlain by eolian LACUSTRINE COMPLEX: channelled, deltaic sediments transitional between glaciofluvial and glaciolacustrine deposits with upper 0-5 m consisting of sand, affected by glaciofluvial channelling; locally overlain by eolian sand; < 20 m thick

Glaciofluvial deposits, outwash sand and gravel locally with a veneer of eolian silt and/or sand; deposited as proglacial sediment by glacial meltwater

GLACIOFLUVIAL PLAIN: flat to gently sloping; 2-20 m thick

rivers or interbedded with other drift types; < 10 m thick

GLACIOFLUVIAL PLAIN, CHANNELLED: flat to gently sloping

GLACIOFLUVIAL PLAIN TO TERRACE: glaciofluvial plain dominant; flat to gently sloping, with no visible boundaries between them; these units occur only along major

GLACIOFLUVIAL TERRACE; 10-50 m thick

GLACIOFLUVIAL VENEER: with slopes conforming to underlying topography; < 2 m

GLACIOFLUVIAL BLANKET: with slopes conforming to underlying topography; gently

to moderately sloping; 3-8 m thick

GLACIOFLUVIAL DELTA: gently sloping, abrupt scarp, showing sudden change in lake level; deposited in a glacial lake; 5-15 m thick

GLACIOFLUVIAL DELTA, CHANNELLED: gently sloping, deposited in a glacial lake; commonly channels cut into underlying till; 5-15 m thick

GLACIOFLUVIAL FAN: mainly coarse gravel with minor sand, locally with mudflow deposits; commonly deposited in a meltwater channel or lake; 5-7 m thick GLACIOFLUVIAL FAN, CHANNELLED: mainly coarse gravel with minor sand, locally with mudflow deposits; commonly deposited in a meltwater channel or lake where no

sudden water level changes had occurred; commonly channels cut into underlying till;

GLACIOFLUVIAL COMPLEX: includes eskers, kames and plains, commonly with

Glaciofluvial deposits, ice contact sand and gravel locally with a veneer of eolian silt and/or sand; deposited as ice-contact sediment by glacial meltwater

GLACIOFLUVIAL RIDGES: eskers; 2-15 m thick

thermokarst ponds in places; 2-30 m thick

GLACIOFLUVIAL COMPLEX, CHANNELLED: containing ridges, hummocks and kettled plains, affected by glaciofluvial channelling; common along Blackwater River;

UNDERSTANDING THE LEGEND

The genetic category of surficial material is indicated by the first upper case letter, e.g., G (glaciofluvial). The morphologic category is indicated in lower case following the genetic category, e.g., Gp (glaciofluvial plain). The modifying processes are indicated in lower case separated from the morphologic category by a (-) e.g., Gp-k (glaciofluvial plain with thermokarst processes).

Combined units are used where, for reasons of scale, the units cannot be separated. The main unit, covering over 50% of the geologic polygon, is separated by a (.) from the secondary unit, e. g., Gp-k.Lp. In cases where the polygon has a third unit it is represented by a patterened symbol, e.g., eolian sand cover, peatlands or fenlands.

Geology by A. Duk-Rodkin, 2007

Digital cartography by B. Firmston and D.A. Lemay Any revisions or additional geological information known to the user would be

welcomed by the Geological Survey of Canada Digital base from Geomatics Canada, modified by the Geological Survey of Canada Mean magnetic declination 2011, 20°55'E, decreasing 24.4' annually. Readings vary from 21°11'E in the NW corner

Elevations in metres above mean sea level

to 20°39'É in the SE corner of the map

Glacial deposits

unsorted silt, sand, and clay with clasts (pebbles, cobbles and some boulders)

TILL PLAIN: flat to gently sloping; 3-5 m thick

TILL PLAIN, CHANNELLED

TILL VENEER: with slopes conforming to underlying topography; < 2 m thick

deposited by glacial ice in a variety of landforms

TILL, DRUMLINOID: hilly till plain with individual drumlins or extensive flutes; 3-15 m

TILL, RIDGED: surface of generally coarse till (20-50% pebbles) deposited as ridges; commonly lateral and frontal moraines and hummocks; < 9 m thick

TILL COMPLEX: largely hummocky, ridged, and/or hilly with patches of gravel; in some places Tx forms veneer over bedrock

forming high ridges; 2-15 m thick Paleozoic to Mesozoic

> Bedrock primarily prominent ridges, escarpments and hills associated with Devonian rocks Cretaceous shale (various colours) and limestone mostly in plains area; Paleozoic limestone, dolomite, shale (various colours), siltstone, mudstone and sandstone

TILL, CREVASSE FILL: coarse diamicton (>30% pebbles) deposited as crevasse fills

mostly in mountainous areas KARSTED: carbonate rocks affected by solution and collapse. Karst forms expressed as sinkholes and channels commonly developed in Mackenzie and Franklin Mountains; Cretaceous shale (various colours) and limestone mostly in plains area; Paleozoic limestone, dolomite, shale (various colours), siltstone, mudstone and

This pattern is used when organic deposits appear as a second or third component in

Fenland constituting 10 - 50% of the map unit

Peatland constituting 10 - 50% of the map unit

sandstone mostly in mountainous areas

Peatlands and fenlands undivided constituting 10 - 50% of the map unit

This pattern is used when eolian sand veneer appears as a second or third component in a polygon, eg. Tp.Gx.Ev Discontinous veneer (<1m) mainly fine sand and silt covering other surficial units and

Colluvial Deposits

bedrock

This pattern is used when colluvial veneer and sheetwash deposits appear as a second or third component in a polygon, eg. Tv.Cx, Tv.Lb.Cx Discontinous veneer (<1m) mainly diamicton and rubble that conforms to local

topography

Geological boundary (defined)

Paleo-drainage scar

Moraine plateau: commonly rimmed and mantled by glaciolacustrine sediments overlying a till core. The moraine plateaus in this area are characterized by rims up to 15 m high enclosing a basinal area. They contain silty-clay sediments to a depth of 2 m; actual thickness of glaciolacustrine sediments are unknown. Moraine plateaus span 100–1400 m in diameter. No till was found below the rims or within the basin area ------ Drumlin, drumlinoid ridge or flute (direction uncertain): streamlined hill or ridge of till with long axis paralleling direction of iceflow

 Drumlin, drumlinoid ridge or flute (direction certain): streamlined hill or ridge of till with long axis paralleling direction of iceflow; elliptical base and arched profile with long gentle slope pointing in downstream direction

Meltwater channel (major): erosion and channel formation by meltwater flow along, beneath or in front of a glacier or ice sheet; range from broad, shallow channels to deeply incised, steep-sided, flat-bottomed valleys; channels may run across or along slope contours; may be presently dry, poorly drained or contains an underfit stream or

Meltwater channel (minor): erosion and channel formation by meltwater flow along, beneath or in front of a glacier or ice sheet; range from broad, shallow channels to deeply incised, steep-sided channels, may run across or along slope contours; may be

Shoreline of former lake: low, ridged beach deposits of sand and gravel

Shoreline of former lake common to two lakes: low, ridged beach deposits of sand and Dune ridge

Deflation hollow
