## 1. Summary

### 1.1 Objectives

This expedition 2010007 is the second cruise of a major international collaboration of NRCan ("Public Safety Geoscience" (PSG) Program) with Japan (JAMSTEC) and the Woods Hole Oceanographic Institution (WHOI). The main objective of this collaboration is to acquire passive seismic data using Ocean Bottom Seismometers (OBS) for earthquake studies. The OBS monitoring will provide direct information on seismic activity beneath the continental slope and further offshore which cannot be provided by land-based seismic networks and therefore will fill a critical knowledge gap. The filling of this knowledge gap is essential to the assessment of earthquake hazard due to the Cascadia subduction fault, an important output of the "Targeted Hazard Assessment in Western Canada" project under the PSG program.

In total, 33 OBSs were deployed during the cruise 2010005-PGC (SeaJade-I) from June 30 to July 10, 2010. The objective of cruise 2010007 was to collect back these OBS.

Secondary objectives of the expedition included acoustic imaging of known methane vent sites (plumes). This imaging was combined with conducting casts using a Conductivity-TemperatureDepth (CTD) measurement-unit attached to a 24 -Niskin-bottle rosette for water-sampling. The water-sampling was conducted to measure the concentration of dissolved methane in the water. The analyses of the water samples are carried out in collaboration with Prof. Dr. Michael Whiticar from the School of Earth and Ocean Sciences, University of Victoria.

### 1.2 Accomplishments and Results

Despite extreme weather conditions due to a storm at the beginning of the cruise forcing a major shutdown of all operations for 60 hours ( 2.5 days) from Friday evening, September $24^{\text {th }}$ to Monday morning, September $27^{\text {th }}$ the OBS were all, except one, recovered. OBS Station 11 did not respond to the acoustic release commands, and the station was abandoned after 4 hours of trials to recover the system.
All 32 OBS were physically (from the outside) in good shape, all transponders and light-strobes worked making the identification of floating instrument and recovery relatively simple, despite, in part, heavy seas. All OBS were brought back to the Pacific Geoscience Centre (PGC), where the glass spheres were opened and all data recovered. Copies of the data set were distributed to the different scientific parties involved.

Due to the weather interruption, only 3.5 days remained in the program to complete the acoustic imaging and water-sampling program. In total, 84 lines were acquired over seven (7) plume locations (2 grids at Bullseye Vent, 2 grids at Spinnaker Vent, 2 grids at Amnesiac Vent, and 2 cross-lines at Barkley Canyon). Out of these lines seven (7) locations for CTD casts and watersampling were chosen. Onboard analyses of some samples showed overall very small amounts of dissolved methane (not exceeding 20 n-moles/l). However, sufficient volumes of gas were collected allowing for post-cruise analyses including isotope measurements at all seven vent locations.

## 2. Narrative

Note that all times are Pacific Daylight Time (UTC - 7 hours)

## Wednesday, September $22^{\text {nd }}$

10:00 Loading begins
16:30 Leave PGC dock
Heading into Saanich Inlet ( $48^{\circ} 39.028^{\prime} \mathrm{N}, 123^{\circ} 30.3054^{\prime} \mathrm{W}$ ) for a first test of watersampling rosette and CTD and METS sensor with Scott Rose (DFO) and Michael Whiticar (UVic) onboard for training.
17:50 On station for test of CTD and rosette; STN SI-1; 190 m water depth
18:00 CTD at bottom, 10 m above seafloor, start firing bottles on up-cast
18:15 Unit back on deck; METS sensor response potentially delayed; will need re-interpretation and more testing for response time of sensor for future deployments;
19:20 Zodiac away with Scott Rose and Michael Whiticar
19:35 Zodiac back on deck
19:40 Under way to first station in Barkley Canyon area to image plume location previously identified in July 2010 expedition

Thursday, September $23^{\text {rd }}$
Transit through the night, start to hit rough weather at exist of Juan de Fuca Straight; 3 m wave height and above 25 kts of wind
12:00 Arrival on station to start first acoustic lines to re-image plume
13:00 Schedule safety training, life-boat, and fire-drill
14:00 Drill completed
Start of imaging acoustic line BC_02 (N-S crossing)
Plume location verified, very close to previous location seen in July, 2010
15:30 Decision was made to go for OBS location 16 instead of a CTD cast to allow for 2 OBS recoveries during day-light to give crew a better feel for the operation Operations for all OBS recovery are summarized in Table 1

OBS recovery continued through the night. Peter Neelands took night shift to assist in the recovery operation.

22:00 Fire-alarm (not a drill)
All Scientific personnel on Muster-Station (Starboard breeze-way)
The smoke alarm was triggered by a fire extinguisher, that got knocked loose and opened in heavy seas; Fire alarm was de-activated 15 minutes after start.

Friday, September $24^{\text {th }}$
Continued OBS recovery through day time; sea-state and wind are increasing (gale force with over 40 kts speed);
19:00 After recovery of OBS STN 6 we stop operation for the night; weather too rough and dangerous for personnel to operate on deck; Captin decided to steam towards more northern-located OBS STN 25 through the night at a course that will be better for a stable ship and re-evaluate weather condition in the morning.

Saturday, September 25 ${ }^{\text {th }}$
07:00 At OBS STN 25; seas and wind have increased, we are near 7 m wave height and steady winds over 45 kts ; heavy rain with low visibility
Decision to abandon recovery and hide at shore until storm system has moved;
08:00 Start course to go into Kyuquot Inlet
13:00 Arriving at shore
Discovery of lost Kayak-team and giving assistance and guidance for team to return to Fair Harbor
15:00 Setting Anchor in Kyuquot Inlet.
Sunday, September $26^{\text {th }}$
Weather has increased offshore with maximum wave heights at 9 m ;
decision was made to not leave inlet until Monday morning
13:00 Test of CTD and rosette for fine-tuning of operation and sub-sampling protocol
Monday, September $27^{\text {th }}$
05:00 Leave Inlet to go to OBS STN 25
12:00 on STN OBS 25
Waves are still around 3-4 meter, winds around 20-25 kts;
operation is safe to continue
OBS recovery sequence continued
Tuesday, September $28^{\text {th }}$
08:00 Weather much more calm, winds down to below 10 kts; waves 2-3 meter
09:30 OBS STN 8 recovered, 10 more to go
22:00 OBS STN 11; no acoustic return signal from OBS;
Continued sending command and awaiting return-signal but no reply from OBS This sequence continued for 2.5 hours until 01:00am when STN was declared officially lost
Wednesday, September $29^{\text {th }}$
01:00 OBS STN 11 declared lost; continue recovery of remaining OBS
06:30 LAST OBS STN 33b recovered
Switch to Plume imaging and water sampling
Acquisition of 10 lines over potential plume locations
Area BV1
(see Table 2, Figure 2, and Figure 3a for all line locations at this location)
11:15 Completion of 10 acoustic lines
The addition of an extra 0.5 nautical miles ahead and after each line made the time for acquisition of the lines almost three times longer. The additional length was a requirement added by the Captain to help ensuring that the boat is along the course and on the intended line; However, the ship was still not very well positioned over the
intended line locations and drifted as much as 60 m away; the lines were initially planned to be just 20 m apart.

Define location for the first real CTD Cast (BV1-1) based on acoustic images using the highest point of acoustic return as guide for proximity to vent location:
Location: $\quad 48.668525^{\circ} \mathrm{N} \quad 126.845227^{\circ} \mathrm{W}$
13:15 Start CTD Cast-1 (BV1-1)
14:45 Completion of CTD Cast 1
Start water sub-sampling
While sampling is under way, we added 4 extra lines North of the grid of acoustic lines of Area BV1

While CTD was taken, ship is drifting considerably of almost 100 m (Figure 4a)
The crew is not using the thrusters to help aid in position keeping!
While drifting, we loose acoustic echo-strength of plume
METS signal shows an abrupt anomaly at 1150 m below sea surface but after this sudden increase the signal is steadily returning to "zero", indicating that we might have oversaturated the membrane.
We did not fire a bottle at this depth, hoping to get similar signal on up-cast.
This turned out to be a wrong decision - we are still learning how to use this METS sensor ...

16:45 Start re-setting of rosette
Picking of location for $2^{\text {nd }}$ CTD cast of the day BV1-2
Location: $\quad 48.670126^{\circ} \mathrm{N} \quad 126.845986^{\circ} \mathrm{W}$
18:00 Start of CTD Cast 2 (BV1-2)
19:20 CTD back on deck
20:00 Start of lines of acoustic lines in Area BV2
over night acquisition of acoustic lines over are BV2 and Spinnaker Vent area SV1 and
SV2 (see Table 2 for times of completion and Figure 3 for locations of lines)
21:30 Completed water sampling
Thursday, September $30^{\text {th }}$
01:50 Start of imaging lines in area SV1
Imaging of area SV1 (southern grid, where cores were taken in 2008 and AUV data were acquired and ROV dives complete din 2009) showed no plumes ...
06:00 Start of lines in area SV2
Picking of location for $3{ }^{\text {rd }}$ CTD cast SV2-1
08:20 Adding a cross-line to verify plume location
Cast-location defined:
Location: $\quad 48.723681^{\circ} \mathrm{N} \quad 126.918400^{\circ} \mathrm{W}$

Thursday, September $30^{\text {th }}$
08:50 Start of Cast-3 (SV2-1)
Ship is drifting significantly;
Again: crew is not using the thrusters to aid in position-keeping
10:20 CTD cast complete, rosette on deck
While water sampling is underway, we added a few lines of acoustic imaging in the Spinnaker SV2 area
11:30 Start transect at 6 kts south to re-position to Bubbly-Gulch;
The line location is going over other known vents (from AUV bottom morphology) but no plumes detected
13:45 At position in bubbly Gulch to do Cast-4 (BG-1);
Here, we have previous knowledge of vents from ROPOS
5 positions, spread over 100 m were picked for special sampling
At each Site we take 4 water-samples at 10,20, 30 and 40 meter above seafloor the remaining bottles are taken at Station 5 in the shallower water column Station keeping here is much improved to before!

Locations
STN1 $48.675330 \quad 126.841700$ (North)
STN2 $48.675220 \quad 126.841300$ (Middle)
STN3 48.674894126 .841283
STN4 $48.674790 \quad 126.841100$ (SE2)
STN5 $48.674770 \quad 126.840700$ (SE1)

15:50 Completed all stations
BBQ for dinner!
19:10 Start acoustic lines at Amnesiac vent area AV1
20:30 finished water-sampling

Friday, October $1^{\text {st }}$
Over night finished all lines at both area AV1 and AV2
Plume at AV1 are clear, but much subdued at AV2
Plume at AV1 is clearly associated with a small topographic high (pinnacle on seafloor)
also seen on the multibeam EM300 map
AV1 plume appears slanted, but highest point is 450 m below sea surface
Picking location for Cast 5 (AV1-1)
5 sub-stations picked across the slanted plume
Locations
AM1 $48.660370 \quad 126.917019$
AM2 $48.659890 \quad 126.916559$
AM3 48.659447126 .916131
AM4 48.658968126 .915679
AM 548.658525126 .915255

07:40 Start Cast-5 (AV1-1)
08:50 CTD back on deck
Selection of $2^{\text {nd }}$ plume location at AV2 area is difficult
S.T. created locations from the acoustic records that well match observations from the 2008 expedition;

09:55 Start X-line across plume locations
We see a plume and decide on location
Upon turn and re-positioning the plume disappeared and only some near-bottom bubbletrains can be seen

We decide to do a cast no matter what ...
11:50 Cast-6 (AV2-1)
Location
$48.665603 \quad 126.901830$
12:55 CTD unit back on deck
13:00 Steam towards Barkley Canyon (4 hours)
18:00 Upon arrival on station the plume seen previously has disappeared!
We see some side-echoes though
Start drifting a little to various locations and start picking up stronger signal especially in the south
Started a mini-drift south and with the cooperation of the bridge we found "optimal" location for the cast where plume is strongest.
Re-positioning of vessel only takes a few minutes
18:30 Ready for Cast-7 (BC-1)
Location
$48.177396 \quad 126.099285$
19:30 Unit back on deck!
Steaming home!
21:30 Water sampling for Cast-7 (BC-1) completed
Saturday, October 2 ${ }^{\text {nd }}$
13:30 Alongside dock at IOS/PGC

## 3. OBS recovery procedures

The locations of the 33 OBS stations are summarized in Table 1.
Example images of the recovery sequence are shown in Figure 4.
An OBS is equipped with an acoustic transponder system which controls the release mechanism and also is used for measuring the range between an OBS and the ship. An OBS is released from its anchor by electric corrosion of stainless plates when a release command is sent from the vessel. A radio beacon ( 43.5880 M Hz ) and flashlight were attached for assisting to find an OBS at the sea-surface when it is recovered.

Standard procedure for the recovery included the following steps:
(1) Upon arrival on station, a transponder was set over the starboard side (about mid-ships across the wet-lab) and lowered to approximately 10 m below the sea-surface;
(2) An acoustic signal was sent to the OBS, which typically acknowledges the command by sending a specific return signal. This is to control that the OBS is still at the location, the transponder is identified correctly and is functional;
(3) Upon receiving the return signal the release command is sent; After the release command is sent, the corrosion process to release the OBS from the anchor takes about 15 minutes; (4) The OBS rises with a speed of approximately 1 m per second ( 60 meters per minute). Estimated arrival times on the surface were communicated to the bridge for optimal use of time of the required deckhands.
(5) The OBS can be seen during day-light relatively easily by it's bright yellow color. Also, as soon as the OBS surfaced, the radio beacon starts operating, aiding in locating the unit. At night, the flash-light makes locating the OBS very easy. Weak ocean currents ensured that OBS surfaced very close to bottom location.
(6) Once the OBS is seen on the surface, the vessel is position carefully so that the OBS is on the lee-side and starboard side of the aft-deck. Quick-release hooks were attached to the OBSmounted recovery-hook using long poles (Figure 4b) and then attached to the crane's hook. The crane turned further out-board to hold OBS away from ship's hull, and a second attached rope hold tight prevented swaying the OBS (Figure 4c), thus avoiding collision with the hull. The unit is then lifted on deck (Figure 4d) and handed over to the OBS technicians for offloading. (7) The OBS was secured, rinsed thoroughly with fresh water, then the OBS recorder was stopped and synchronized with GPS, all attached parts were removed, and the unit was leached on deck.

In order to help keeping the vessel on station during the OBS ascent, the transponder was typically brought back on deck within 1-2 minutes once the release of the OBS from the anchor was confirmed. Several times the OBS ascent was monitored on the 12 and 18 kHz echosounder system (Figure 5), which help predicting the time when the OBS was to arrive on the seasurface.

## 4. Acoustic Imaging of gas plumes

Using the ship-board 12 kHz echosounder, as well as the dual-frequency $18+38 \mathrm{kHz}$ sounder, we collected several profiles across known vent locations in the area of Bullseye Vent, and IODP Expedition 311 boreholes. In previous cruises on the CCGS John P. Tully in 2006 and 2008, water-column plumes had been observed using the same systems. The plumes often extended from the seafloor to water depths near 500 m .

During this cruise, the 12 kHz was used with the RAM extended, giving much better images than during previous cruises (esp. 2010005 June 30 - July 10, 2010). The two echosounder systems have different beam-widths ( $12 \mathrm{kHz}: 7^{\circ} ; 18+38 \mathrm{kHz}: 5^{\circ}$ ) and depending on the water depth, create a relatively large foot-print (up to 300 m across). Therefore, the plumes are imaged only in a side-view.

Several sets of parallel lines (typically 20 m , once 40 m , apart) were designed to image the plumes and when necessary, cross-lines through the points of highest-plume-echo (measured from seafloor up) were added to verify the location. Seven areas were covered (Figure 2, 3): A set of two crossing lines were completed at the beginning of the expedition at a vent first identified in July 2010. Six (6) additional areas were covered for detailed plume-identification: Two (2) grids at Bullseye Vent and Bubbly-Gulch, where 2 distinct large plumes were seen; Two (2) grids at Spinnaker vent (North and South), and two (2) grids at Amnesiac Vent (East and West). Examples of plumes from each location are shown in Figure 6.

Typically, after acquisition of the acoustic lines, the points of highest plume-echo were chosen and transferred to the GIS computer for mapping. Additional crossing lines through those points were acquired to verify the plume location (and to get the best position for a CTD cast) at Spinnaker Vent Area 2, Amnesiac Vent Area 1, and Amnesiac Vent Area 2. Two cross-lines through the area of Bullseye Vent were coincidentally acquired while approaching and leaving the OBS location 33b (near the NEPTUNE-Canada node 889 seismometer).

Detailed specifications of sounders:

- Simrad EK60 Multi-frequency Scientific Echo Sounder using an ES18-11 18kHz Split-beam Transducer with a 3-db Beam Width of 11 degrees, - ES38-12 38kHz Split-beam Transducer with a 3-db Beam Width of 12.5 degrees. Both transducers are hull-mounted. Output power is 2000 W at 2.048 msec pulse length.
- Simrad EA600 Single-Frequency Hydrographic Echo Sounder using a 12-16 12kHz Singlebeam Transducer with a 3-db Beam Width of 15.2 degrees. Transducer is mounted on an extended ram. Output power is 2000 W at 2.048 msec pulse length.

## 5. CTD and Water Sampling

The 24 Niskin bottle rosette (SBE carousel) and Seabird SBE911plus CTD unit from the IOS Water-properties lab were used during the cruise to collect water samples for dissolved methane analyses in collaboration with Prof. Dr. Michael Whiticar from the School of Earth and Ocean Sciences, University of Victoria.
The CTD unit has the following sensors:

- Dual Temperature sensors, ITS-90
- Dual Salinity sensors - PSU
- Digiquartz Pressure sensor - Depth salt water
- Seapoint Fluorometer
- Transmissometer, Chelsea/Seatch/WET Lab CStar
- SBE 43 Oxygen sensor
- Altimeter

Additionally, a CAPSUM METS Methane Gas detector (METS) was used to help guide watersampling locations. The METS sensor was borrowed from Bob Collier, Oregon State University through collaboration with Dr. Michael Whiticar. The installation of the METS sensor and connection to the CTD was achieved and a regular channel of the CTD (in our case optical water transmissivity) was used to display the methane concentrations. The METS provides 2 Voltages Gas Concentration and Gas Temperature at 24 samples/second. The SBE 911plus was loaded with the METS configuration data to automatically calculate and plot Methane Concentration in micromoles/l and Gas Temperature in degrees C. All data were captured and displayed by Seasave 7.20 g software.

The methane concentrations are calculated using the internally-measured temperature using the following equation:
$\left[C H_{4}\right]=\exp \left[D * \ln \left\{\left(B 0+B 1 * \exp -\frac{V_{t}}{B 2}\right) *\left(\frac{1}{V_{m}}-\frac{1}{\left(A 0-A 1 * V_{t}\right)}\right)\right\}\right]$
$\left[\mathrm{CH}_{4}\right]=$ Methane concentration $[\mu \mathrm{mol} / \mathrm{L}]$
$\mathrm{V}_{\mathrm{m}}=$ methane concentration voltage [V]
$\mathrm{V}_{\mathrm{t}}=$ temperature concentration voltage [V]
$\mathrm{A} 0=4.055$
$\mathrm{A} 1=2.303$
B0 $=-0.016$
$\mathrm{B} 1=1.247$
$\mathrm{B} 2=0.808$
$\mathrm{D}=1.783$
$\mathrm{T} 1=22.78$
$\mathrm{T} 2=-4.62$

## Water sampling procedure:

From each Niskin bottle water was removed using syringes. Each time a sample was taken, the syringes were rinsed three times before a real sample was collected from the bottle. After water (typically $50-60 \mathrm{ml}$ ) was collected in a syringe, excess air-bubbles were removed (syringes were tapped slightly to help evacuate air) and excess water was released until exactly 30 ml of water remained in the syringe. After that, air was added back into the syringe to the maximum volume of the syringe itself ( $62-64 \mathrm{ml}$, the exact volume was recorded for each syringe). When sampling for isotope measurements, larger syringes were used where 70 ml of water were collected per sample, and an extra 70 ml of air was added.
After that, each syringe was shaken vigorously for one (1) minute and allowed to rest for at least one (1) minute. The head-space gas was either analyzed in the Gyro or transferred into evacuated Wheaton bottles for onshore analyses and stores at $4^{\circ} \mathrm{C}$.

Selected samples were immediately measured onboard using the Gyro ${ }^{\mathrm{TM}}$ optical spectrometer by Isometric Instruments. If elevated methane concentrations were detected, additional sub-sets (30 ml as well as 70 ml ) were taken for later onshore analyses, including measurements for carbonisotopes.
The Gyro was regularly calibrated by running air-samples (known methane concentrations in air are around 1.8 ppm or $2 \mathrm{n}-\mathrm{mol} / \mathrm{l}$ dissolved in water).
Station-keeping of the vessel at the cast location was not always easy to achieve due to the different wind and current conditions. For the last three cast locations the bow-thrusters were used, which improved the quality of station keeping immensely. Images of the vessel track-line during the CTD casts are shown in Figure 7.

All CTD-casts measurements are shown in Figure 8 and each methane profile from the METS sensor is again shown in a separate figure (Figure 9).
Examples of the CTD unit and water-sampling rosette are shown in Figure 10.

One complication on interpreting the different signals of the echosounders and the location of the CTD/rosette is related to their physical location onboard the vessel relative to the position of the navigation GPS antennae. The location of the sounders, CTD-winch, and GPS antennae is shown in Figure 11.

Table 1
(a) Recovered OBS stations (in sequence of actual recovery)

| OBS <br> Number | Date | Day | Time (UTC) | Depth <br> (m) | Latitude | Longitude |

| S-N. | Michelle Coté | $06: 00-18: 00$ | Water-sampling, |
| cabin |  |  | Watchkeeper |
| B | Rita Wania | $06: 00-18: 00$ | Water-sampling |
|  | Andrea Price | $06: 00-18: 00$ | Water-sampling |
|  | Nastasja Scholz | $06: 00-18: 00$ | Watchkeeper, OBS |
| C | Kathrin Naegeli | $18: 00-06: 00$ | Watchkeeper, OBS |
|  | Steve Taylor | $06: 00-18: 00$ | Lab / echo-sounders |
| D | Yojiro Yamamoto | $24: 00-12: 00$ | OBS technician |
|  | Koichiro Obana | $12: 00-24: 00$ | OBS management |
|  | Ikumasa Terada | $12: 00-24: 00$ | OBS technician |
|  | Kaoru Tsukuda | $24: 00-12: 00$ | OBS technician |
| F | Peter Neelands | $06: 00-18: 00$ (CTD) | Lab/navigation/OBS |
|  |  | $18: 00-06: 00$ (OBS) | Water-sampling |
| G | Martin Scherwath | $18: 00-06: 00$ | Watchkeeper, OBS |

## Table 6

CCGS John P. Tully Crew

| Position Title | Name |
| :---: | :---: |
| Commanding Officer | Quaye, Andy H. |
| Chief Officer | Gibson, Donald D. |
| 2nd Officer | Lovelace, R. Shane S. |
| 3rd Officer | Garrett, James |
| Boatswain | Sanderson, Randy |
| Leading Seaman | Harris, Piper |
| Leading Seaman | Burdon, Michael |
| Deckhand | Harrison, Ryan |
| Deckhand | Lahaise, Matt |
| Deckhand | Hyde, Zachariah |
| Deckhand | Brunet, Jesse |
| Chief Engineer | Horton, Roger D. |
| Engineer | Bellyk, Scott |
| Engineer | Owens, Vaughan A. |
| Oiler | Creelman, Ron G. |
| Oiler | MacRae, Michael J. |
| Chief Cook | Zettell, Samuel |
| 2nd Cook | Gamblin, James D. |
| Steward | Quast, Colin |
| Steward | Schwarz, Megan |
| Steward | Watson, Kristina |

Figure 1
(a) Map of OBS locations. The OBS stations with instruments from WHOI will remain until early summer of 2011. (White lines represent location of vintage multi-channel seismic data, 1985, 1989, 1999). OBS stations 33a, 34a, and 35a were previously recovered during cruise 2010005PGC in July 2010.

Figure 1
(b) Map of OBS locations as shown in (a) but with track-line of recovery-sequence.

## Figure 2

Map of vent-locations visited during the expedition 2010007
(a) Bullseye Vent and Bubbly Gulch

Figure 2
Map of vent-locations visited during the expedition 2010007
(b) Spinnaker Vent

Figure 2
Map of vent-locations visited during the expedition 2010007
(c) Amnesiac Vent

(c) Amnesiac Vent

Figure 3
Acoustic lines acquired (black) and proposed (yellow) over Plume locations
(d) Barkley Canyon

Figure 4
Examples of OBS recovery. (a) OBS floating in water, the radio beacon (red) and flash-light (yellow) are mounted at the sides of the floatation-sphere (main yellow body of OBS); (b) Quick-release hooks are attached to the main OBS-recovery-hook; (c) The quick-release-hook is then attached to the main crane and lifted out of the water; (d) OBS arrives on deck.

 Figure 5
Example of the track of an OBS echo seen on the 18 kHz echosounder system. The OBS rises at a speed of $1 \mathrm{~m} /$ second ( 60 meter per minute). The records of the OBS ascent were possible only on the days after the storm was over and seas/wind had considerably calmed down.

## Figure 6

(b) Location of vessel on CTD cast 2 at Bullseye Vent Area 1 (BV1-2)

Figure 7
(c) Location of vessel on CTD cast 3 at Spinnaker Vent Area 2 (SV2-1)

Figure 7
(d) Location of vessel on CTD cast 4 at Bubbly Gulch (BG-1)

Figure 7
(e) Location of vessel on CTD cast 5 at Amnesiac Vent Area 1 (AV1-1)

Figure 7
(f) Location of vessel on CTD cast 6 at Amnesiac Vent Area 2 (AV2-1).

## Figure 7

(g) Location of vessel on CTD cast 7 at Barkley Canyon (BC-1). Note that the intended Castlocation (\#7) was chosen based on initial acoustic data from the two cross-lines over the plumelocation (from July 2010 cruise). However, upon arrival on that location the plume was not as clear in the echo-sounder data as previously imaged. We started a drift around this location and picked up a much stronger signal of the plume towards the south (marked by blue arrow), upon which the CTD-cast was completed.

## Figure 8

(a) CTD Cast-1 (BV1-1) at Bullseye Vent. Sequential numbers (1-24) on left hand side indicate location depth when Niskin-bottle was fired.

## Figure 8

(b) CTD Cast-2 (BV1-2) at Bullseye Vent. Sequential numbers (1-24) on left hand side indicate location depth when Niskin-bottle was fired.

## Figure 8

(c) CTD Cast-3 SV2-1 at Spinnaker Vent Area 2. Sequential numbers (1-24) on left hand side indicate location depth when Niskin-bottle was fired.

## Figure 8

(d) CTD Cast-4 (BG-1) at Bubbly Gulch. Sequential numbers (1-24) on left hand side indicate location depth when Niskin-bottle was fired.
