

F O R E W O R D

In line with its function of disseminating information of importance to the mineral industry, the Mines Branch is, indeed, pleased to publish this bibliography on rock bolting methods.

Rock bolting is now a well established support system in mines. Much literature has been published over the years, particularly during the early period of experimental application.

Mrs. J.H. Paterson, née Mary Ruth Corlett of Kingston, Ontario, compiled the bibliography in 1958 at the University of London (Britain), as part of the requirements leading to a diploma in Library Science.

This work is the result of an extensive search of the published literature describing rock bolting practice in various countries. The bibliography includes abstracts which are expected to make this a useful and convenient reference work for both mining and operational staffs. It is intended to follow up Mrs. Paterson's publication with a companion information circular (Part II) on reference works on rock bolting for the decade 1958-1967, to be prepared by our mining research and technical information staff.

John Convey,
Director,
Mines Branch.

Ottawa, September 18, 1968.

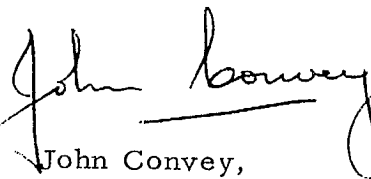

A V A N T - P R O P O S

A titre de service à l'industrie minière, la Direction des mines est heureuse de publier cette bibliographie sur les méthodes de boulonnage.

Le boulonnage des roches est une technique de soutènement bien établie dans l'exploitation minière. Beaucoup d'ouvrages ont été publiés sur ce sujet depuis déjà plusieurs années, en particulier durant la période des premières applications expérimentales.

Mme J.H. Paterson, née Mary Ruth Corlett à Kingston (Ontario), a rassemblé cette bibliographie en 1958 à l'Université de Londres (Grande-Bretagne); ce travail faisait partie des exigences pour l'obtention d'un diplôme en bibliothéconomie.

Ce travail est le résultat d'une recherche approfondie sur les ouvrages publiés décrivant les méthodes de boulonnage de la roche pratiquées dans plusieurs pays. La bibliographie comprend des résumés qui rendront cet ouvrage fort utile aux mineurs et au personnel de bureau. On prévoit qu'une circulaire d'information (Partie II) traitant des travaux de référence sur le boulonnage de la roche pour la décennie 1958 à 1967, suivra la publication de l'ouvrage de Mme Paterson; elle sera préparée par notre personnel d'information technique sur le génie minier.

John Convey,
Directeur,
Direction des Mines.

Ottawa, le 18 septembre 1968.

Mines Branch Information Circular IC 207

BIBLIOGRAPHY ON ROCK BOLTING METHODS IN MINING PRACTICE.

PART I: ABSTRACTS FROM WORLD LITERATURE TO END OF 1957

by

Mary Ruth Corlett Paterson *

SYNOPSIS

Issued as Part I of a proposed series, the bibliography which comprises this information circular represents a serious attempt to assemble all the published information of the theory and practice of rock bolting to the end of 1957. It was completed as a two-year project in library research in London, England, in 1958. Part II, now in preparation, will cover the decade 1958-1967.

In this bibliography, some 280 references (each with a brief abstract) are grouped according to subject matter under main headings of Theory, Testing Equipment, Specifications and Standards, Drilling and Dust Control, Safety Precautions, Practice (General), and Practice (Regional--by countries). Chronology is from late to earlier.

Three appendices list Conferences, Suppliers of Equipment, and Sources of Information. Indexes are included of Authors, of Companies and Other Public Bodies, and of Subjects.

* In 1958, then Miss Mary Ruth Corlett of Kingston, Ontario, Mrs. Paterson compiled this bibliography at the University of London (England) as part of her requirements for a diploma in Library Science. Reassembled and co-ordinated at the Mines Branch, Ottawa, during the summer of 1968, it is being reproduced and distributed by the Mines Branch as a Canadian contribution to scientific knowledge, by permission of the author.

Direction des mines

Circulaire d'information IC 207

BIBLIOGRAPHIE SUR LES MÉTHODES DE BOULONNAGE
DANS LES EXPLOITATIONS MINIÈRES.
PARTIE I: RÉSUMÉS D'ÉTUDES PUBLIÉES DANS LE MONDE
ENTIER JUSQU'À LA FIN DE 1957

par

Mary Ruth Corlett Paterson*

RÉSUMÉ

La bibliographie qui fait l'objet de la présente circulaire vise à réunir tous les ouvrages publiés jusqu'à la fin de 1957 sur la théorie et la pratique du boulonnage des roches. Cette bibliographie est le résultat de deux années de recherche en bibliothéconomie entreprise en 1958 à Londres. Une deuxième circulaire, en voie de préparation, couvrira la période de 1958 à 1967.

Dans cette bibliographie, quelque 280 ouvrages de référence (chacun accompagné d'un bref résumé) sont groupés selon leur sujet sous les titres suivants: théorie, appareils d'essai, prescriptions techniques et normes, forage et suppression de la poussière, mesures de sécurité, pratique (générale), pratique (régionale ou par pays). La chronologie va du plus récent au plus ancien.

On trouvera dans trois appendices une liste des conférences qui ont porté sur ce sujet, des fournisseurs de matériel et des fournisseurs de matériel et des sources de renseignement. On trouvera aussi les index des auteurs, des sociétés et autres corps publics et des sujets.

* En 1958, Mme Paterson, alors Mlle Mary Ruth Corlett de Kingston (Ontario), a établi cette bibliographie à l'Université de Londres en vue de l'obtention d'un diplôme en bibliothéconomie. Réorganisée et coordonnée à la Direction des mines (Ottawa) durant l'été de 1968, cette bibliographie sera reproduite et distribuée par la Direction des mines à titre de contribution canadienne à l'avancement de la science, avec la permission de l'auteur.

AUTHOR'S PREFACE (1958)

Rock bolting as a method of ground support in underground mining has received considerable attention during the past ten years. Generally speaking, this method involves either the bolting together of thinly bedded rock to simulate a thick bed, or the anchoring of unstable rock to more solid rock above.

There are two basic types of bolts: the slot-and-wedge, commonly referred to as the wedge-type or slotted type, and the expansion shell. As well as these, wooden bolts and concrete injection-type bolts are also used.

Applications of bolts in rock support have been recorded in Europe as early as 1912 and in the U.S.A. in 1917. Much early development work was done in the U.S.A. by the St. Joseph's Lead Co., Missouri, and the U.S. Bureau of Mines. In the U.K. coalfields, research was carried out by Z.S. Beyl, a Dutch engineer. At present the method has been tested and used for many purposes in coal and metal mines in sixteen countries of the world.

. .

An attempt has been made, in this bibliography, to assimilate all the published information of the theory and practice of rock bolting up to the end of 1957. Material has been collected from a number of libraries in London (England): the Institution of Mining and Metallurgy Library, the Institution of Mining Engineers' Library, the National Coal Board Library, the Patent Office Library, and the Guildhall Library.

The following bibliographical sources were used: D.S.I.R. Translated Contents of Russian Scientific Periodicals; Engineering Index; Fuel Abstracts; I.M.M. Abstracts; Safety in Mines Research Establishment, Abstracts of Current Publications; and U.S. Bureau of Mines, List of Publications. The 1957 volumes of many important mining journals have been individually checked to ensure that the bibliography is up to date.

In each case the original paper has been studied and abstracted. The small number of references which were not available have been marked with an asterisk (*). A number of unpublished translations have also been recorded.

To assist the reader the references have been grouped according to subject matter and arranged chronologically. A limited number of cross references have been included, but to locate all the articles on any particular aspect it is necessary to refer to the subject index.

Because the practice of rock bolting is developing in both coal and metal mining in many different countries, it is difficult to follow

a standard form of nomenclature. Generally the terms found in the original text have been used in the abstract. In the subject index, an attempt has been made to include See references to guide the reader to the appropriate heading.

I should like to thank Mr. A. Grierson of the Royal School of Mines, Mr. R. Staveley of the School of Librarianship, University of London, the Librarians of the libraries listed above, and Miss Leila Crisp for their assistance in compiling this bibliography.

Mary Ruth Corlett

Kingston, May 1958

A. T H E O R Y

1. POTTS, E.L.J. & JENKINS, J.P.
Le boulonnage du toit, les mouvements des couches et les propriétés des roches (Roof bolting, bed movement, and the properties of rocks).
Rev. Ind. Minérale 1957 39 (11) Nov 1003-1012.
This is a theoretical discussion of rock bolting in terms of elasticity of rocks, anchorage characteristics, and tension of the bolt.

2. SHIROKOV, A.P.
Kvoprosy opredeleniy parametrov ankernod krepki (Determination of parameters of rock bolts).
Ugol 1957 (9) 23-27.
Includes detailed graphs and diagrams. 6 references to Russian literature.

3. JOHNSTON, A.G.
Roof bolting in mines: theory and practice.
Iron & Coal Trades Rev. 1956 173 (4615) 2 Nov 1077-88; discussion 1088-90.
A detailed account is given, with many diagrams and illustrations: principles of roof bolting; laboratory investigations and results (suspension support, compound beam, arched roadway support); underground observations; strata movement; tension testing. Tests were carried out at Northfield Colliery, Lanarkshire. 17 references.

4. CORLETT, A.V.
Rock bolting in the Voussoir beam: the use of rock bolts in ground support.
Can. Min. & Met. Bull. 1956 49 (527) Mar 156-60; discussion 1956 49 (535) Nov 763-4.
C.I.M.M. Trans. 1956 59 88-92; discussion 1956 59 431-2.
Principles of rock bolting practice are discussed. The theory of beam formation is developed; a numerical example shows the magnitude of the strain along the Voussoir arch. Factors which influence the effectiveness of support by bolting include scaling, early support, anchorage, tension. References.

5. PANEK, L.A.
Principles of reinforcing bedded mine roofs with bolts.
U.S. Bur. Mines, Rep. Inv. 1956 (5156) Mar 26p.
Attempt to develop bolting theory; beam theory; function of roof bolts; behaviour of bolted roof; bolting pattern. Numerous models, load-strain graphs, tables are given. References.

6. PANEK, L.A.
Theory of model testing as applied to roof bolting.
U.S. Bur. Mines, Rep. Inv. 1956 (5154) Mar 11p.
Description of models, method (centrifugal) and model prototype relations are given. By using dimensional analysis, a general expression for a roof-bolting design formula in terms of structural variables has been obtained. References.

7. PANEK, L.A.
Design of bolting systems to reinforce bedded mine roof.
U.S. Bur. Mines, Rep. Inv. 1956 (5155) Mar 16p.
Mining Eng. 1955 7 (10), Oct 954-7; discussion by J.P. ZANNARAS 1956 81 (12) Dec 1228.
A method (with design chart) for designing systems of vertical bolts to reinforce horizontally bedded mine roofs, developed from model tests, is given. References.

8. HOFFMAN, H.
Wirkungsweise und Anordnung der Anker in Abbaustrecken
(The method of functioning and arrangement of roof bolts in gate roads).
Glückauf 1955 91 (9-10) 26 Feb 239-41 (Typescript N.C.B., Translation A933/ME).
The author is concerned with the best bolting pattern in relation to the dip of the strata. Work is based on theories advanced by Jacobi, who compared the strata with planks piled on top of each other. This theory and those of Grabsch, Hoevens and Rolshoven are discussed. Diagrams and 4 references.

9. THOMAS, E.M.
Rock bolting finds wide application.
Mining Eng. 1954 6 (11) Nov 1080-5.
This general article gives the following classifications with examples of bolting techniques: suspension; beam building; reinforcement of the skin areas; reinforcement of walls.
17 references.

10. GRABSCH, W.

Neuere Erkenntnisse über die Gebirgsbewegungen beim Ankerausbau in Abbaustrecken (Recent findings on rock movements with rock bolting at the face).
Glückauf 1953 89 (10 Oct) 1037-48 (Typescript M.F.P., Translation L.T.S. 1337).

Discussion under the following headings: specifications in roof support; support and rock bolting; comparison of subsidence measurement, using set support and anchor bolts; measurement of movement in higher hanging walls; wall movement and anchor bolting; suggestions for suitable bolt. Theories of rock movement and support are discussed; numerous diagrams and illustrations show bolting patterns, rock movement with different types of support, etc. 11 references.

11. HERZOG, H.

Dachschieferbergbau und theorie des Ankerausbau
(Roofing slate mining and the theory of rock bolting).
Bergbau Rundschau 1953 5 (Feb) 73-4.

With reference to work done by Hoevels, Rolshoven and Jacobi, bolting of roof and wall is discussed.

12. JACOBI, O.

Zur Statik der Ankerausbaues (The statics of rock bolting).
Bergfreiheit 1952 17 (1) 9-16 (Typescript N.C.B., Translation A 850/FWH).

A discussion of theory of bolting is put forward in which roof layers bolted together are compared with timber boards. It is stated that timber boards subjected to bending stress will deflect 9 times more when loosely packed than when dowelled together. The following topics are discussed: theoretical beam of unstratified rock without rock bolts; dowel action of rock bolts; thrust reinforcement, tension reinforcement; arch formation; rock bolts in semi-plastic and plastic rock. Diagrams show clearly the effect of pressures on rock formation before and after bolting.

13. HEYL, Z.S.

The prestressed state of the earth's crust, its causes and preservation.

Conf. Rock Pressure & Support, Liege, 1951. 395-407.

A detailed discussion is presented under the following headings: stress distribution in the rock mass; prestressed state of the rocks; the so-called "Pressure-Wave" application of rock pressure to support; the "Heyl Reinforcement". Tests were carried out at Glebe Colliery, Washington Coal Co., Durham, 1942; Bickersham Seam, Maypole Colliery, Wigan, Lancs., 1946; Silksworth Colliery, Sunderland, Durham,

1947-49; Bowland-Forest Tunnel, Lowgill, Lancs., 1949.
Numerous diagrams and illustrations are given.

14. PRICE, P.H. & CROSS, A.T.
Geologic considerations in roof bolting.
Coal Mine Modern. Yearb. 1951 97-111.
Discusses, using numerous examples of American coal mines, the nature of various rocks associated with coal - shale, sandstone, clay - and their reactions to bolting. Excellent diagrams are given.

15. SCOLLON, J.A.
Roof bolting vs. roof rock stresses.
Mechanization 1951 15 (10) Oct 105-9.
Studies of rock stresses are outlined, showing the effect of bolting in carrying the load and developing an effective arch. Various patterns are illustrated.

16. BUCKY, P.B.
Theory of rock bolting.
Coal Mine Modern. Yearb. 1950 13-24.
The following are discussed: geological structural elements that affect rock bolting; elastic theory limitations; present research using Barodynamic model studies on thick strong immediate roof and thin bedded roof.

17. BEYL, Z.S.
Rock pressure and roof support.
Colliery Eng. 1945 22 (Sep) 206-8, 213; (Oct) 220-2; 228;
1946 23 (Apr) 84-8; (Jun) 149-51; (Aug) 213-6; (Oct) 260-4.
Following an outline of the compressive forces operating in rock pressure, the author shows how the use of rock bolts to hold laminated strata in the form of a beam will support a mine roof. Successful tests using Rawlbolts are described; installation cost is considered; bolting patterns are presented. The last article deals with the development of knowledge on the problem of rock pressure from 1892. 13 references.

18. BEYL, Z.S.
Suggested methods of roof control.
Iron & Coal Trades Rev. 1943 146 (3919) 9 Apr 533.
A brief account of the use of reinforcing anchors sunk in sand and clays to support walls. Method has been used in the Netherlands. Tests are being carried out in a British colliery.

B. TESTING

19. POTTS, E.L.J.
Further progress in the scientific approach to strata control.
Inst. Mining Eng. Trans. (London) 1957 117 (3) Dec 203-219.
In this article, dealing with developments in instrumentation in relation to strata control, a device for the measurement of bed separation and the development of continuous recording equipment for measuring the loads on face supports and bolts are discussed. Numerous illustrations and diagrams are included. 4 references.
20. PANEK, L.A.
Anchorage characteristics of roof bolts.
Mining Congr. J. 1957 (11) 43 Nov 62-64, 89.
Discusses the significance of head displacement and evaluates anchorage performance. It is possible to state the most effective bolt assembly using expansion or wedge-type bolt.
21. CHEMICAL ENGINEERING AND MINING REVIEW
Rubber compression pad for measuring tension in roof bolts.
Chem. Eng. Mining Rev. 1957 49 (12) 16 Sep 44-46.
A description is given and application described of the rubber compression pad developed by U.S. Bureau of Mines and Goodyear Tire & Rubber Co.
22. SPINDLER, G.R. & WORREL, D.T.
Geological aspects of mine roof action and control.
Mining Congr. J. 1957 43 (7) Jul 68-70.
A report of the Committee on Roof Action, of the American Mining Congress. Graphs and tables are put forward to give relation of strength of bolt anchorage to installation torque and to hardness and stability of strata.
23. FORRESTER, G.N.
Smaller drilled holes... high strength rock bolting... takes hold in Canadian mines.
Can. Mining J. 1957 78 (3) Mar 66-9.
Results of tests carried out by the Steel Co. of Canada are outlined. Tests were done on breaking strengths and pull, to show effect of changing the size and the material of the bolt. Trends in Canadian rock bolting are briefly outlined; recommended practice is put forward. Numerous diagrams illustrate equipment.
24. IRON AND COAL TRADES REVIEW
Measurement of roof bolt tensions.
Iron & Coal Trades Rev. 1957 174 (4628) 1 Feb 277.
S. African Mining Eng. J. 1957 67 (3325) 2 Nov 701, 703.
The compression pad developed by Goodyear Tire & Rubber Co. is described.

25. WOJCIECHOWSKI, J.J. & HOLLAND, C.T.
Some aspects of roof bolt action in a coal mine roof.
Mineral Ind. J. Virginia Polytech. Inst. 1956 3 (4) Dec 1-7.
Summary in Mining Ind. Rev. 1957 101 (1) 31 Jan 33.
An investigation of the following factors: holding strength of wedge and expansion bolts; anchor holding strength of sandstone and shale roofs at various depths of insertion; roof sag in mine entries having different types of support; load variations on an installed bolt. Numerous tables, graphs and diagrams illustrate results. References.
26. SMEDBERG, M.
Provdragning av bergförankring (Anchorage testing of mine rock bolts).
Jernkontorets Ann. 1956 140 (Dec) 930-45. (Swedish text-English summary).
Anchorage testing of bolts, both wedge and expansion type, is described. Results are based partly on U.S. Bureau of Mines reports, but mainly on tests at Swedish coal mines of the HBganäs-Billesholms Company. 16 references.
27. ANTONIDES, L.E.
How you can predict rock falls.
Eng. Mining J. 1955 156 (12) Dec 75-7, 103.
This equipment, consisting of a geophone, amplifier and earphones, tests the effectiveness of ground support such as rock bolting. Field procedure is outlined, with graphs.
28. KRONER, R.
Der Drehmomentenschlüssel beim Ankerabau im Erzbergbau
(The torque key in rock bolting in ore mines).
Bergbau Rundschau 1955 7 (Nov) 597-602.
A theoretical discussion of its use with graphs, diagrams, formulae. 32 references are given to German and American sources.
29. OBERT, L. & BARRY, A.J.
Roof bolt compression pad, a new device for measuring tension in roof bolts.
Mining Congr. J. 1955 41 (7) Jul 35-6.
Designed by U.S. Bureau of Mines, and produced by Goodyear Tire & Rubber Co., this pad permits rapid determination of bolt tensions up to 20,000 lb with accuracy of ± 1000 lb. It is designed for use with 1-in. slotted-type bolts and smaller-diameter expansion-type. References.

30. BARRY, A.J., PANEK, L.A. & McCORMICK, J.A.
Anchorage testing of mine roof bolts.
Part 1. Slotted-type bolts.
U.S. Bur. Mines Rep. Inv. 1954 (5040) Mar 12 p.
Testing apparatus consists of a hydraulic jack assembly and a device (extensometer or cathetometer) for measuring displacement of the bolt as it is loaded. Numerous graphs, illustrations, tables are given. References.
- Part 2. Expansion type, $\frac{3}{4}$ -in. bolts.
U.S. Bur. Mines Rep. Inv. 1956 (5194) Feb 19 p.
Tests carried out show various factors affecting anchorages: deformation of expansion plug; hole diameter; slotted-type versus expansion-type. References.
- Part 3. Expansion type, $\frac{5}{8}$ -in. bolts.
U.S. Bur. Mines Rep. Inv. 1957 (5310) Feb 8 p.
Tests on five makes of expansion-type shells and two grades of bolts (mild steel and high strength) used in sandstone and shale roof. Anchorages obtained in all cases were stronger than either grade of bolt. A graph gives relationship for evaluating anchorage effectiveness of $\frac{5}{8}$ -in.- and $\frac{3}{4}$ -in.-diameter, headed, expansion-type bolts. References.
31. COAL AGE
Wood headers cause a decrease in roof-bolt tension.
Coal Age 1953 58 (Dec) 112-13.
A graph shows changes in bolt tensions with various setups of wood headers. A diagram illustrates laboratory method used to study bending and compression loading of wood pieces for effect on bolt tension. Work was done by Ohio Brass Co.
32. PANEK, L.A.
Roof bolt testing.
Mining Congr. J. 1953 39 (6) Jun 47-9.
Details given here are contained in U.S. Bureau of Mines Reports of Investigations 4967, 5040, 5080, 5154, 5156, 5194, 5228, 5155, 5310. (Nos. 5, 6, 7, 30, 34)
33. WUERKER, R.G.
Testing of roof bolting systems installed in concrete beams.
Mining Eng. 1953 5 (6) Jun 606-14.
Following a brief review of the theories of rock bolting, a testing procedure is outlined to determine whether or not the bolts would increase strength in the same way horizontal bars and stirrups increase the strength of the common reinforced concrete beam. Numerous diagrams, graphs and illustrations are included.
42 references.

34. BARRY, A.J., PANEK, L.A., & McCORMICK, J.A.
Use of torque wrench to determine load in roof bolts.
Part 1. Slotted-type bolts.
U.S. Bur. Mines Rep. Inv. 1953 (4967) May 7p.
Equipment and procedure for testing slotted-type bolts is outlined. Tests show that a torque of 260 ft-lb applied to a nut on a slotted-type bolt will produce a load of 10,000 ± 2,700 lb on the bolt. Neither the type of thread nor the type of rock affects the torque-load relationship. The torque wrench is considered a practical instrument for checking the tightness of bolts.
Part 2. Expansion-type $\frac{3}{4}$ -in. bolts.
U.S. Bur. Mines Rep. Inv. 1954 (5080) Oct 17p.
Factors influencing the torque-load relationship for various bolts. References.
Part 3. Expansion-type, 5/8-in. bolts.
U.S. Bur. Mines Rep. Inv. 1956 (5228) May 13p.
A study of torque-load relationship showed that it was not significantly affected by the type of bolt or expansion shell unit but might have been affected by the type of rock. References.
35. WHITTAKER, J.S.
Roof bolt testing.
Mining Congr. J. 1952 38 (12) Dec 65.
Abstract of report given at 1952 American Mining Congress. Work being carried out on testing bolt tension and the load-bearing capacity of the bolt anchorage are outlined.

Describes the use of C.F. & I. (Colorado Fuel & Iron) Realock chain-link fabric to prevent spally or blocky ground from falling out of back or walls between the bolts. Various applications are shown, including one with triangular plates as used in Scandinavia. Specifications for the fabric are tabulated.

42. SMEDBERG, M.

Kontroll av bergförankring (Rock bolting control).
Tryckluft 1956 11 (4) 1-6.

This descriptive article shows equipment for bolting. Excellent diagrams illustrate auxiliary equipment; e.g. Goodyear's compression pad, bolt tightener, etc. 19 references.

43. MECHANIZATION

Efficiency increased 400% in roof bolt assembly program.
Mechanization 1952 16 (5) May 99.

The manufacture of expansion shell and plug bolts of $\frac{1}{2}$ -in. or $\frac{5}{8}$ -in. diameter, 34 in. long, at Princess Elkhorn Coal Co., David, Kentucky is described. Blacksmith can assemble 225 bolts in $7\frac{1}{4}$ hours.

44. TROLLER, T.H. & CALDER, A.W.

Mechanical equipment for roof bolting in coal mines in U.S.
Conf. Rock Pressure & Support, Liege 1951 338-94.
(English and German texts).

Available American equipment is described: wedge- and expansion-type bolts, portable compressor, wagon-mounted stoper, dust collector, self-propelled rotary drill, hydraulic roof drill attachment, hydraulic impact wrench, roof-hole gauging instrument.

45. ENGINEERING AND MINING JOURNAL

How to make your own roof bolts.
Eng. Mining J. 1950 151 (12) 112.

A brief description of the jigs, troughs and Airco Radiograph used to make wedge-type steel bolts at East Diamond Mine, West Kentucky Coal Co., Madisonville, Ky.

(2) VARIOUS BOLTS

46. POPOV, G.N., RICHIK, F.F., RYMINTSEV, V.G & TARAKANOV, G.M.
Shtangovai Krepi Y ochistnich virabotkach (Rock bolting
at the face).
Gornyi Zhurnal 1957 (9) 27-29.
The bolt does not appear to be a conventional type. It has a
conical plug at the end and an expanding brace about halfway
down the rod. The bolt is 1050 mm long.
47. SHEWMAN, D.C.
Take the guess out of bolting a roof.
Coal Age 1957 62 (8) Aug 80-82.
A means of estimating necessary rock bolt length by measuring
drilling time is put forward. A design for a bolt having two
heads with a shear zone between is presented. This shear zone
would be designed to fail at a particular torque, thus providing
a definite torque limit. Means of making such a bolt are discussed.
48. WETLINSKY, W. de
Les boulons plafonniers. Leur utilisation dans les mines
(Roof bolts; their use in mines).
Tech. Moderne 1956 48 (9) Sep 465-9.
This well illustrated article gives basic information on rock
bolts - wedge, Hubbard, Pattin, G.H.H. and Boltex types. The
Perfo tube is also described. 3 references.
49. MECHANIZATION
Was this the beginning of roof bolting?
Mechanization 1956 20 (Aug) 61.
In 1917, J.C. BALDWIN of Sagamore Mine, Pocahontas Fuel Co., W.Va.,
used $\frac{3}{4}$ -in.-diameter, 18-in., wedge-type bolts to support loose
intermediate roof.
50. SMEDBERG, M.
In-och utlandska-nyheter på bergbultsomradet (Swedish and
foreign advances in rock bolting).
Tryckluft 1956 11 (1) 5-13.
Review gives recent advances in equipment: Republic Steel Corp.
expansion bolt; West Virginia Manufacturing Co. expansion bolt,
and others. Excellent diagrams are given.
51. BERGBAU RUNDSCHAU
Mehrteiliger Gebirgsanker für den Ankerabau
(Construction of a new rock bolt).
Bergbau Rundschau 1956 8 Jan 17-8
(Typescript N.C.B., Translation M 3581/DJS). (An abridgement)

In this bolt the outer sleeve is made of flexible material to form a continuous elastic casing, the diameter of which is greater than the borehole when the sleeve is relaxed. The sleeve anchors itself against the walls of the hole. To increase the elastic force of the bolt and thus to improve its load-bearing capacity, a central rod is used. A diagram is given.

52. MINING JOURNAL

Parallel expansion of roof bolts.

Mining J. (London) 1955 245 (6274) 18 Nov 587.

The Victor Products (Wallsend) Ltd. parallel-expansion bolt has been developed specifically for use with rotary drills. It requires no impact for tightening. Equipment is illustrated.

53. ECUER, R.

Le boulon d'ancrage au terrain; matériaux du boulonnage (Rock bolting; bolting materials).

Rev. Ind. Minérale 1955 36 (617) Feb 268-77. (Typescript N.C.B., Translation A 988/SEH).

Describes in detail wedge- and expansion-type bolts and their application. Excellent diagrams of the positions of the bolts during installation are given.

54. FULTON, K.E.

Rock bolts and allied techniques of ground control.

Assoc. Mine Managers, S.Africa, Papers and Discussions

1954-55 355-63; Contributed remarks by J.C. Hall 363-64.

Since 1945 at Van Dyck Consolidated Mines, South Africa, shale footwall has been controlled by driving old drill steel into holes 42 in. deep. As a result of experience gained with these steel pins, 1-in. wedge-type rock bolts were used in stope tracks and development ends. Subsequently $\frac{3}{4}$ -in. wire rope was used in place of bolts to prevent dangerous side-wall conditions in deeper areas. Details, including costs, are given.

55. ORLOWSKI, L.

Nowy system obudowy Kotwiowostropnicowej w Kopalniach wegla (A new system of rock bolting in collieries).

Wiadomosci Gorni. 1954 (3) Mar 70-74 (Typescript N.C.B., Translation A.767/AB).

Tests have been carried out using bolts and channels at Wieczorek and Pawel collieries in Poland. Bolts are conically tapered bars, 40-45 mm in diameter, 650-700 mm long, with ribs for increased friction. A wedge-type pin, 40 mm in diameter, joins the roof bar and bolt together. Applications have been in headings and airways. Installation and withdrawal details are given; detailed diagrams show various applications.

56. HAFLIDSON, R.S., SHORT, E.S., GAUTHIER, A., & GRIEVE, A.R.
Replacement of rock bolts with used hoisting rope cuts costs of holding ground.
Eng. Mining J. 1953 154 (1) Jan 100-2.
At East Malartic Gold Mines Ltd., Norrie, Quebec, the roof consists of highly sheared, taloose greenstone and greywacke. In the latter, rock bolting has been successful, but has been replaced by the use of wire hoisting rope and cement. Three examples of its use are outlined.
57. ECUER, R.
Le boulon d'ancrage dans la roche outil de base du soutènement suspendu; le boulonnage du toit; le "Boltex", création française (Roof bolting. The Boltex, a French invention).
Rev. Ind. Minérale 1952 33 (587) Dec 979-86 (Typescript M.F.P., Translation L.T.S. 118).
Following a brief discussion of the fundamental aspects, the Boltex is favourably compared with the Hubbard expansion bolt. Numerous diagrams illustrate their functions.
58. ROSEAUX des, E.
Le boulonnage du toit; effet du glissement d'ancrage, un boulon sans glissement. (Rock bolting. The effect of slipping. A slipless bolt.).
Rev. Ind. Minérale 1952 33 (585) Oct 784-6.
Following a distinction between the terms "broche" (peg) and "boulon" (bolt), a recoverable "broche pour raclage" (peg for support) is described. It consists of a bolt, a rubber sleeve, casing, a peg, and support.
59. ALLMAN, G.
Le boulon d'ancrage à expansion "Ancrall" (Expansion bolt "Ancrall").
Rev. Ind. Minérale 1952 33 (585) Oct 787-89.
Describes the "Ancrall" expansion bolt used at Petite-Roselle collieries, Lorraine.
60. SCHATZ, H.J.
Der Ausbau mit Ankerbolzen (Bolted support).
Bergbau Rundschau 1952 4 579-80.
Description and application of wedge and split-sleeve bolts.

61. ENGINEERING AND MINING JOURNAL

New wrinkles in roof bolting.

Eng. Mining J. 1950 151 (12) Dec 105.

"Coal companies are experimenting with three unusual roof-bolting techniques: (1) Wooden pins of 2-in. diameter with slots at both ends. A wedge at one end is driven against the bottom of the hole and a wedge at the other clinches the roof surface. (2) Grouting holes with cement to replace pins. This cements crevices together and prevents initial rock alteration and slough. (3) Grouting steel pins in place to increase bond between steel and rock."
(Complete text)

62. ZEITSCHRIFT FÜR BERGBAUHÜTTENWESEN UND SALINENWESEN

Streckenausbau mit eisernen Ankern (Support with iron anchors).

Z. Berg.-Hüttenw. u. Sal. 1919 67 Versuche und Verbesserungen 7-8.

This is a section in a review of mining in Prussia, 1918. An installation, at Friedenshütte (Bergrevier Königshütte O.-S) in the Ruhr district, in which anchor bolts were used is described. The bolts were long enough so that the end was firmly held in solid rock. Anchorage was achieved by a series of 'Keilringe' (trapezoid-shaped objects) near the end of the rod. When the bolt was tightened, these shapes were forced together thus expanding to hold the bolt firm. This work was done by A. BUSCH.

(3) WOODEN BOLTS

63. KELLY, L.W.

Successful use of wooden roof bolts in Stony Point Mine, Stony Point Coal Co., Hopkins Co., Ky.

U.S. Bur. Mines Inf. Circ., 1952 (7637) Jun 4p.

At Stony Point Mine where the roof immediately over the coal is a stratum of laminated, hard black shale from 8-36 in. thick, slotted-type 1 5/8-in. wooden bolts, 3 ft long, are used. A pattern of 7 bolts for each 7-ft cut is used and four-bolt set is followed at an interval of 3 1/2 ft by a 3-bolt set, and so on. Bolts are installed with sledge hammers immediately after loading machine leaves the face.

F. SAFETY PRECAUTIONS

78. THOMAS, E.M.

Bolting for safety.

Mining Congr. J. 1957 43 (1) Jan 65-6.

A discussion of poor working habits in rock bolting, holdovers from timbering practices. Company regulations must be adjusted to take full advantage of the safety of bolting techniques. For example, bolting machines have booms or telescoping jacks to bear against roof and serve as support.

79. ASH, S.H.

Health and Safety in mineral industry.

Mining Eng. 1953 5 (2) Feb 174-6.

Statistics show a decrease in roof-fall accidents since the introduction of bolting. Graphs give breakdown by type of mine.

80. WESTFIELD, J. & ANDERSON, F.G.
Hazards of roof bolting.
Coal Mining 1952 29 (6) Jun 10-12, 14.
Gives 21 hazards incident to bolting, mainly concerned with care in installation. Dust problem is discussed with reference to the Königsborn dust exhauster. Paper read at 65th Meeting of Coal Mining Institute of America.
81. MILLER, P.S.
Roof bolting in tunnels.
Mining Congr. J. 1952 38 (6) Jun 30-2.
Advantages of roof bolting are discussed generally (based on a talk given before the National Safety Council Meeting, Chicago, Ill.).
82. BROWN, E.H. & BIERER, J.
Roof bolting in West Virginia.
Mining Congr. J. 1951 37 (5) May 31-5.
Development from 1947-1950. Following an outline of causes of accidents in bolting practices, e.g., bolts too far apart, or inadequate pillar support, rules which should be followed are put forward. A table gives comparative study of roof and timber accidents.
83. THOMAS, E.M.
Roof bolting to prevent accidents.
Coal Mine Modern. Yearb. 1950 40-43.
A short review of bolting developments, with emphasis on safety aspects. A diagram shows details of a roof-fall accident. Location is not given.
84. COAL AGE
Coal mining section surveys progress in mine safety at National Safety Congress.
Coal Age 1950 55 (12) Dec 136-7, 165-84.
Among papers presented at the Congress and reviewed in this article are those by the following on bolting: G.O. TARLETON, Consolidation Coal Co. (Ky.), Jenkins, Ky.; A.T. CROSS, West Virginia Geological Survey, Morgantown, W.Va.; G. McCOA, Consolidation Coal Co. (W.Va.), Fairmount, W.Va.; G.N. McLELLAN, Weirton Coal Co., Isabella, Pa.; A. METCALFE, U.S. Bureau of Mines Dept., Fairmount, W.Va.; P. PRICE, State Geologist, Morgantown, W.Va.

107. HUSTON, E.F.

How to install roof bolts.

Coal Age 1954 59 (6) Jun 98-100.

With numerous diagrams and illustrations, the installation and checking of bolts are demonstrated.

108. RABCEWICZ, L.v.

Bolted support for tunnels.

Water Power 1954 6 (4) Apr 150-5; (5) May 171-5.

A detailed account with many diagrams of rock bolting in unstable rock. Examples are drawn from the Foiçacava, Brazil and New York tunnels. Development is outlined and recommended techniques are given.

109. HOEST, U.

Der Ankerbau im Steinkohlenbergbau (Rock bolting in an iron mine).

Freiberger Forschungshefte 1954 A20 115-135; discussion 135-136.

A general descriptive article with numerous diagrams and illustrations. Examples are drawn from German and American sources. Lengthy bibliography.

110. SHARPE, C.
Roof and floor bolting; effect on strata control.
Iron & Coal Trades Rev. 1953 167 (4468) 27 Nov 1243-6.
This general article describes equipment, bolting patterns, and the fixing of bolts.
111. GRIERSON, A.
Principles and practice of roof bolting.
Mining J. (London) 1953 241 (6160) 11 Sep 298-300.
Describes the expansion-shell and wedge types of bolt, the equipment required for their installation, load tests, and installation procedures. It is stated that the reinforcement of strata by means of rods was first put forward by Z.S. Beyl in 1912 and was applied in 1914 in U.S.A.
112. YOUNKINS, J.A.
Roof support for continuous mining (in coal mines). A report of the Mechanical Loading Subcommittee, describing methods and practices of roof support in several coal fields.
Mining Congr. J. 1953 39 Jul 44-6.
Summary of reports proposed for roof support in continuing mining:
(1) drills for bolting mounted on the continuous machine;
(2) a modified mining system to eliminate delays for timbering;
(3) a step-face system to permit timbering nearer the face;
(4) a system of concurrent bolting and mining.
113. WRIGHT, A.
Roof bolting.
Sheffield Univ. Mining Mag. 1953 15-17.
Synopsis of a paper, presented to the Sheffield Mining Society in 1952, in which bolting equipment and practice are outlined.

(1) AUSTRALIA

131. HORSEMAN, R.C.

Roof bolting at John Darling Colliery, Belmont, New South Wales.

Australasian Inst. Mining Met. Proc. 1954 (172) Mar-Jun 163-89.

Describes in detail bolting techniques since 1950 for supporting the shale-type roof. Wedge-type mild-steel bolts, 1-in. diameter, 4-5 ft long, are used. Various methods of drilling were tried in an effort to reduce dust hazard. Hydraulic rotary boring is now general practice, but a change to electric boring is anticipated in the future.

132. PARTEL, W.S.

Roof bolting in Australia.

Coal Mining Conf. Otago Univ. Proc. 1953. Paper No. 29. 9p. Critically describes practices at Wangaville Colliery, New South Wales, and Phoenix Colliery, Collie coalfield, Western Australia, and experiments at Hebo, Old Bulli and Burwood, Stockton Borehole and Newstan Collieries, in New South Wales.

133. HILL, A.H.
Roof bolting in Australian metal mines.
Mining J. (London) 1953 240 (6141) 1 May 510-11.
This gives a brief account of practices in Australia. The only mine actually mentioned is Broken Hill, New South Wales.
134. HILL, A.H.
Roof bolting in metal mines.
Rhod. Mining Rev. 1953 18 (Mar) 17-19, 21.
General article on bolting practices in Australian metal mines, including costs.
135. MCKENSEY, S.B.
Roof bolting and pillar workings, Elrington and Hebburn No. 2 Collieries.
Australasian Inst. Mining Met. Bull. Supplement. 1952 (Feb) 40p.
Following a description of strata in these New South Wales collieries, experiments carried out and bolting practice are discussed. In each case, wedge-type bolts of 1 in. diameter have been adopted. Reference is made to Australian steel specification AS-A1-1940. The theory and mechanics of bolting are put forward; practical suggestions regarding equipment, supervision, bolt manufacture are given. Illustrations and diagrams are included.

(2) AUSTRIA

136. FABRICUS, O.
Betriebs versuche mit Ankerabau im Braunkohlentiefbau
(Experience with rock bolts in brown coal mines).
Berg.-hüttenmänn. Monatsh. montan. Hochschule Leoben.
1956 101 (7) Jul 141-51.
This detailed article describes bolting techniques in Trimmel Kam coal mine, Salzach-Kohlen-Bergbau-Ges. m.b.H., Oberösterreich. Various types of bolts are used. 16 references. Numerous graphs, etc.

(3) BRAZIL

137. RABCEWICZ, L.V.
The Forçacava Hydro-Electric Scheme.
Water Power 1953 5 (9) Sept 332-37; (10) Oct 370-77; (11) Nov 429-35.
This comprehensive article describes excavation for an underground machine hall with adjoining pressure shaft for the projected power plant at Forçacava, Brazil. Rock bolts, channels and netting were used successfully in sections of the pressure shaft where rock was very unstable, where gneiss was intersected by fault zones, of completely kaolinized material, mostly parallel to the stratification.

(4) CANADA

138. CORLETT, A.V.

Ground support.

Paper in Mining in Canada, p. 337-48.

Published by the General Committee of the Sixth Commonwealth Mining & Metallurgical Congress, Vancouver, B.C., Canada. 1957. 597pp. \$10.

Outlines developments in rock bolting in Canadian mines. An analysis of practice, based on published reports and on information received from 76 Canadian mines, is given. Tables give statistics on the extent of use of rock bolts and the ratio of tons mined to bolts used in the various applications. Data on bolts and auxiliary equipment are analyzed to provide a basis for evaluation. It is mentioned that except in the case of Newfoundland none of the provinces has a stated policy on the use of bolts. Numerous installations are described and illustrated. 13 references.

139. SEMEVSKII, V.N.

Kreplenie metallichesкими shtangami pri sploshnoi rasrabotke na shachtach "Dominion" v Kanada (Rock bolting in longwall working in the Dominion mines in Canada).

Ugol 1957 (9) 45-7.

Illustrated summary of article by L. FROST (No. 143.)

140. SEMEVSKII, V.N.

Shtangovai krepі na rydnikach Kanada (Rock bolting in Canadian mines).

Gornyi Zhurnal 1957 (5) 57-62.

Material is taken from articles published in Canadian Mining Journal 1953, and Canadian Mining and Metallurgical Bulletin 1955.

141. TEAL, J.K.

Roof bolting practice at Kerr-Addison.

Can. Mining Met. Bull. 1955 48 (521) Sep 541-4.

C.I.M.M. Trans. 1955 58 285-88.

Wedge-type bolts of 1-in. diameter, 5-8 ft long, are installed at a rate of approximately 1200 per month. First used in 1952, they are employed in drifts, raises, shaft stations, stopes, and gangways. Bolting patterns and average cost are given.

142. MCKELVEY, R.C.

Roof bolting practices at Lamaque.

Can. Mining Met. Bull. 1955 48 (521) Sep 545-47.

C.I.M.M. Trans. 1955 58 289-91.

Standard bolt is of wedge type of mild steel, of 5/8-in. diameter, and 5 1/2-ft long. Bolt testing by torque wrench, standard installation techniques, cost, and advantages are outlined. Atlas Diesel equipment is used.

143. FROST, L.

Development of roof bolting in the collieries of the Dominion Steel & Coal Corp. Ltd. in the Sydney Coal Field.

Can. Mining Met. Bull. 1955 48 (521) Sep 548-56.

C.I.M.M. Trans. 1955 58 292-300.

Experimental work is outlined. Split bolts, 7/8-in. diameter, are standard. Operating details, e.g. dust problem, are considered. Numerous photographs and diagrams are included.

144. DEWEY, J.H.

Roof bolting at International Nickel Company.

Can. Mining Met. Bull. 1955 48 (521) Sep 557-62.

C.I.M.M. Trans. 1955 58 301-6.

Bolting is carried out in stopes which normally required square setting, in fresh-air raises and in shaft stations in place of the conventional steel beam support. Guniting is sometimes done in conjunction with bolting. 1-in. wedge-type bolts in 4- and 6-ft lengths, with left-hand rolled threads and 1 1/8-in. heavy hexagonal nuts, are standard.

145. SMITH, A.T.

Rock bolting practices at Britannia.

Can. Mining Met. Bull. 1955 48 (521) Sep 563-5.

C.I.M.M. Trans. 1955 58 307-9.

Standard bolts at Britannia are 3/4-in. expansion-shell type. Bolting practices, first applied in 1950, are carried out in drifts, crosscuts, shaft stations, charging stations and timber storage areas.

146. THOMAS, E.M.

Rock bolting; summary of symposium.

Can. Mining Met. Bull. 1955 48 (521) 566-8.

C.I.M.M. Trans. 1955 58 310-12.

Symposium includes the following papers: (Nos. 141-45.)

147. MORRISON, D. & FORSYTHE, A.

The institution and practice of roof bolting in the Cape Breton collieries of Dominion Coal Co., Ltd.

Can. Mining Met. Bull. 1954 47 (509) Sep 694-9.

C.I.M.M. Trans. 1954 57 452-57.

Bolting support in roadways in the various collieries is described. Wedge-type bolts, $\frac{3}{4}$ -in. diameter, of various lengths, are used in patterns determined by the particular condition in each colliery. Difficulties due to side-squeezing, roof settlement, adjacent wall out of alignment and broken strata are considered. In some cases, rock bolting was unsuccessful.

148. MINE AND QUARRY ENGINEERING

Lake Shore Mine (Kirkland Lake, Ontario)

Mine & Quarry Eng. 1954 20 (6) Jun 240-52; (7) Jul 304-11.

The application of the "Foran" rock bolt, an expansion-type bolt with a rubber sleeve, made by Heath & Sherwood Ltd., Kirkland Lake, Ontario, is discussed briefly in the first article of the series.

*149. CASSIDY, P.M.

Roof bolting at the Ruffner Iron Ore Mines, British Columbia.

Current safety topics in the mining industry, 1953.

Nat. Safety Council Trans. 1953 20 42-44.

150. BROWN, A.

Roof bolting in Canadian coal mines.

Can. Mining Met. Bull. 1953 46 (450) Dec 744-56.

C.I.M.M. Trans. 1953 56 400-12.

Outline of the practices at Dominion Coal Co., Bras d'Or Co., and Inverness No. 5 Colliery, all in Nova Scotia; Canadian Collieries (Dunsmuir) Ltd.; T'Sable River Mine, Vancouver Island, B.C.; Lethbridge Collieries, Ltd., Galt No. 8 Mine, Alta; Red Deer Valley Coal Co. Ltd., Nacmine Colliery, Drumheller, Alta; Crowsnest Pass Coal Field, B.C. Gives comparative costs.

151. CANADIAN MINING JOURNAL

Rock bolting practices in Canadian metal mines.

A symposium.

Can. Mining J. 1953 74 (9) Sep 56-72.

Gives equipment, procedure and costs. Includes the following papers from Ontario Mines Accident Prevention Association Symposium:

- (1) At Aunor Gold Mines Ltd. by S. THIB (slotted-type bolts);
- (2) At Macassa by J.D. BRYCE (split-pin-type bolts);
- (3) At Halnor (Ontario) by J.A. HALL (split-wedge-type bolts);
- (4) At Lake Shore Mines by M. SEYMOUR (split-pin-and-wedge and "Foran" bolts);
- (5) At Quemont by W.D. JAMIESON (slotted-type bolts);
- (6) At Hollinger by B. AWDE (expansion-shell-and-plug bolts);
- (7) Summary by E.M. THOMAS.

152. HUBER, W.G.

Complex excavation pattern cuts out underground power house.
Civil Eng. 1953 23 (6) Jun 396-401.

A description of operation at Kemano Alcan Development, B.C.
There is brief mention of the use of slot-and-wedge pins or fish bolts to support rock areas above the roof arch which were loosened by blasting.

153. BALLACHEY, A.G., JAMIESON, W.D. & HAMBLETON, J.R.

Mining at Quemont.

Can. Mining Met. Bull. 1952 45 (477) Jan 58-69.

C.I.M.M. Trans. 1952 55 57-68.

In this general article on mining practice at Quemont Mine, Noranda, Que., brief mention is made of the use of split-wedge, 1-in.-diameter, 5-8 ft long, mild steel bolts to give additional support to both back and walls.

154. DWARKIN, L.M., DOXEY, F. & JOHNSTON, J.C.

Roof bolting (in coal mining).

Can. Mining Met. Bull. 1951 44 (476) Dec 779-87.

C.I.M.M. Trans. 1951 54 485-93.

General discussion of bolting followed by descriptions of practice at Four Star Colliery, Cape Breton, N.S., by J.C. JOHNSTON and at Dominion No. 20 Colliery, Sydney, N.S., by F. DOXEY. Comparative costs are given. Bibliography.

162. SCHERING, E.

Über die Verwendbarkeit von Firstankern im Salzgestein
(On the application of rock bolts in rock salt).

Kali u. Steinsalz 1956 2 (Aug) 37-42.

A detailed description of the various types of bolts, with emphasis on the split-sleeve and expansion types, and their applicability in German salt mines. Graphs and illustrations are included.

163. GÖBEL, P.

Die Bewährung von Ausbau verschiedener Art beim Unterbauen und Überbauen Querschlagen und Richstrecken Sowie von Anker Ausbau in abbaustrecken (Experiences with various methods of support when working below or above crosscuts and headings and with roof bolting of gate roads).

Glückauf 1956 92 (17 Mar) 305-20

(Typescript M.F.P., Translation L.T.S. 2056A (only pp 312-20)).

Includes details on bolting trials at Prosper III mine of Arenberg Bergbau GmbH, confirmed the value of bolts in gate roads. Emphasis is placed on trials in a middle road serving two faces. A fall during trials provided valuable information on causes involved.

164. LÜCK, H.

Erfahrungen beim Rauben von Anker Ausbau

(Experience in withdrawal of bolting support).

Glückauf 1954 91 (13-14) 26 Mar 353-56

(Typescript M.F.P., Translation L.T.S. 1781).

A description of conditions of the roof at Albert I seam, Windgasser firm, Duisberg, after withdrawal of bolted support. No serious fall occurred. Method of withdrawal is given; efficiency and costs are outlined. Economic results were more favourable here than in a similar American experiment.

165. MIDDENDORF, R. & JANSSEN, K.
Erfahrungen mit dem Ankerabau (Bolting experience).
Glückauf 1953 89 (33-34) 15 Aug 809-22
(Typescript M.F.P., Translation L.T.S. 1261).
A general discussion based on practice at the Neumühl colliery under the following headings; examination of rock by means of the Kugel chlaghammer (hardness tester); pull tests; design of bolts; applied tension; drilling of boreholes; examples of bolting Albert I seam, Gretchen seam; floor bolting; anchorage bolting supports in stone drifts; in upbrows and downbrows in virgin ground; bolting as ancillary to supports; economics of bolting; safety. A very detailed breakdown of costs at Albert I seam is given. 10 references.
166. GIMM, W.
Der Ankerabau im Kalibergbau (Rock bolting in potash mines).
Bergbautechnik 1953 3 169-73.
Following a general description of practices in German potash mines, a theory of ground support in relation to bolting is discussed.
167. LANGECKER, F.
Versuche zur Verankerung der Gebirgsgeschichten, besonders im Liegenden (Experiments on bolting, particularly foot wall bolting).
Glückauf 1952 88 (45-46) 8 Nov 1086-90.
Experiments in bolting very broken strata, especially floor strata, were carried out in the Hausham and Peissenberg coal pits, Upper Bavaria. Bolting with concrete proved successful. Pressure tests on model workings are described. Bolts described are 14 and 19 mm diameter to withstand stresses of 6-8 tons and 10-14 tons respectively. Roof bolting has also been investigated but has not been applied.
168. BRUN, L.
Boulonnage du toit (Roof bolting).
Rev. Ind. Minérale 1952 33 (585) Oct 773-83.
Experiments were carried out at Griesborn colliery, Saar district, using wedge-type bolts 30 mm in diameter, about 1.50 m long. Numerous applications - roof, workings, shaft stations, etc. - and comparative costs are considered.
169. MIDDENDORF, H. & JACOBI, O.
Ankerabau in Abbaustrecken (Rock bolting)
Glückauf 1952 88 (25-26) 21 Jun 636-45
(Typescript N.C.B., Translation No. A. 237/AB).
Report of experiments carried out at the Neumühl pit, Albert No. I seam, G.H.H. Co., Oberhausen. The geology of the mine and various theories of bolted support are discussed. Detailed diagrams show equipment used - wedge- and split-sleeve-type bolts. Results of experiments, testing methods, and bolting patterns are given. References.

La bullonatura del tetto (Roof bolting).
Ind. Mineraria, 1953 4 (Mar) 107-18; (May) 199-206.
Part 1 covers materials and applications in Italy. Following a brief review of the history of bolting from the early work by BUSCH, the various types of bolts are described - wedge, expansion, split-sleeve, the Ancrall, Hubbard, Ohio Brass, Werner, and Boltex types. Installations in various foreign countries - U.S., France, Germany and in Italy - Nicciolota mine, Soc. Montecatini, Baccinello mine, Soc. Mineraria del Valdarno and the marble quarry of Soc. An. Marmi di Lasa, Val Venosta, Bolzano, are described. Part 2 discusses theory of rock pressure in relation to bolting, based on work by SPRUTH, FENNER, LABASSE, JACOBI, AND BUCEY, papers presented at the Liège conference, 1951, and work done by U.S. Bureau of Mines. Diagrams show installation patterns. 48 references.

173. LOCKINGTON, F.E.

Roof bolting at Wairaki State Mine.

Coal Mining Conf. Otago Univ. Proc. 1953

Paper No. 30. 12 p (including discussion).

This was the first bolting application in New Zealand, in 1950. Bolting experiments using split-rod-and-wedge, $\frac{3}{4}$ -in-diameter, mild steel bolts $5\frac{1}{2}$ ft long, boring operations using rotary drills, and comparative costs are outlined. Bolts were applied to haulage roads, a fan drift and a stone drive, in moderately wet soft sandstone.

174. TROFTEN, E.

In Norway it's roof sewing - in Sweden the method is simple (Perfo bolting).

Eng. Mining J. 1956 157 (9) Sep 78-81.

Details are given of the technique used at Sulitjelma mine, Norway. Difficult ground is supported by weaving a continuous arch of rock and concrete to carry the strain. A cost breakdown is given.

175. SANDVIK, P., HJELSETA, H., & BERGE, I.

Takbolting i gruver (Rock bolting in mines).

Tidsakr, Kjemi Bergvesn. Met 1956 16 (6) 93-9.

Norwegian bolting practice at the Orkla mine of the Løtken Co., Orkla Grube A/B; the Follalds mine, Follald Verk A/S; and the Fosdals mine, Fosdalens Bergverks A/S. Detailed diagrams and illustrations show methods of installation. Wedge-type bolts are used with triangular-shaped plates, and sometimes in conjunction with wire mesh. The method of cementing boreholes is also applied.

176. AUSTIN, C.C. & TROFTEN, E.

Roof sewing.

Eng. Mining J. 1953 154 (9) Sep 91.

Describes practice at Sulitjelma Mines, Norway.

Cribbed pillars of schist blocks and conventional split-end bolts have been used in stopes for 20 years to support the top. Roof sewing is used where the bolt is not sufficient. It involves (1) a hole drilled 2-3 m deep; (2) wire rope; (3) vent pipe; (4) a short pipe connected to grouting pipe and a Silex plug; (5) grouting of hole with concrete gun at 300 lb pressure.

183. ROUILLARD, R.J.

Roof bolting.

Assoc. Mine Managers S. Africa, Papers and Discussion. 1954-55. 337-42; contributed remarks by L.F. Calmeyer 342-54.

Assoc. Mine Managers Transvaal Circ. 1954 (1) 15 Jan. 3 p.

Bolting, it is stated, has not been generally accepted on the Rand but it has been used for various purposes during the last few years: (1) support of side wall and roof in a very high excavation; (2) support of shaft station roof; (3) temporary support in inclined shaft sinking; (4) semi-permanent support in haulages; (5) ventilation duct; (6) temporary support in a circular vertical shaft; (7) undercutting strata in stopes. Further applications at Durban Roodepoort Deep are put forward by CALMEYER.

220. ZELENKOV, S.E.

Roof support in Colorado.

Mining Congr. J. 1952 38 (5) May 32-4.

Experience at the Kokomo, Indiana unit of American Smelting & Refining Co., dating from 1949. Slotted-type bolts, 6-8 ft long, 1-in. diameter, were used. Cost was less than timbering.

221. HILANDER, A.C.

Roof bolting eliminates timber at Telluride.

Eng. Mining J. 1950 151 (12) 110.

Gives a diagram and brief description of use of bolts in occasional sections of tunnel of Telluride Mines, Inc., Telluride, Colo. The rock is red medium-bedded sandstone. Bolts are of $1\frac{1}{4}$ -in. diameter, 5-10 ft long, wedge type.

IDAHO

222. FARMIN, R. & SPARKS, C.E.

The use of wooden rock bolts in the Day Mines.

Mining Eng. 1953 5 (9) Sep 922-4.

Describes the use of wooden bolts of wedge type, approximately 2-in. diameter, 4-6 ft long, using a headboard 30 in. long, at Day Mines Inc., Wallace, Idaho. Roof is shaly quartzite and argillate. 3 references.

223. FOSTER, W.B.

Rock bolting progress at Sunshine.

Mining Congr. J. 1953 39 (7) July 26-8.

In 1952, Sunshine silver mine in Shoshone Co., Idaho, began to use rock bolts of 1-in. diameter, 6 ft long with $\frac{3}{8}$ by 8-in.-square plates. An Ingersoll-Rand 534 Impact Wrench was used. Bolting pattern was required to support 25 sq ft of ground for every 5 bolts. Difficulties due to a slabby hanging wall were overcome by installing 6-ft bolts in a fan-like pattern. Bolting is being used in stopes with success.

ILLINOIS

224. KELLY, L.W.

Economic benefits of systematic roof bolting in the Ziegler

No. 3 Mine, Bell & Zoller Coal & Mining Co., Williamson Co., Ill.

U.S. Bur. Mines Inf. Circ. 1952 (7633) May 9p.

Describes bolting practice in this mine where the intermediate roof consists of 28 ft of soft white unstratified weak shale. The main roof consists of 10 ft of well-indurated black shale. Double expansion bolts, $\frac{3}{4}$ -in. diameter and 5 ft long, were used in conjunction with occasional timber. Another application described is the support of trailing cables.

225. COAL AGE
Efficient machine mining.
Coal Age 1952 57 (4) Apr 74-7.
Includes description of roof support at No. 40 mine, Peabody Coal Co., Galatia, Ill., using steel crossbars and 1-in.-diameter, wedge-type bolts 30 in. long.

Economies through roof bolting in an Indiana coal mine.
U.S. Bur. Mines Inf. Circ. 1952 (7653) Nov 10p.
Detailed analysis of the cost of roof bolting a main haulage road at King's Mine compared to the cost of timbering. Other applications are shown. Bolts used are 1-in.-diameter wedge type, 4 ft long, with 6 by 6 by 7/8-in. steel plates.

KENTUCKY

231. FLETCHER, R. & PRUNTY, M.E.

Roof bolting equipment and practices. Roof bolting equipment.

Roof bolting practices and experiences at Jenkins, Ky.

Mining Congr. J. 1956 42 (11) Nov 80-4.

Available stoppers, single rotary drills, two-drill machines, steels and bits, wet and dry drilling equipment are outlined. Experiences at No. 3 Elkhorn seam, Consol (Ky.), Jenkins, Ky., are discussed briefly. Standard bolt is $5/8$ to $3/4$ in. diameter, expansion type, 36-72 in. long. Bolting pattern is fixed at 4-ft centres; wet rotary drilling equipment is generally used.

232. EDWARDS, J.H.

How wood pins serve Mary Gail.

Coal Age 1954 59 (3) Mar 182-4.

Since 1952, wood pinning has been used in this soft shale mine of Mary Gail Coal Co., Hyden, Leslie Co., Ky., using room mining techniques. Hickory pins are $1\frac{1}{2}$ in. diameter, 36 in. long, with 8-10 in. slots at each end. Pins do not begin to fail for about a year. Where immediate shale top is soft, plates are sometimes necessary.

233. KNIGHT, H.E.

Development of roof bolting equipment.

Coal Mine Modern. Yearb. 1953 25-35.

At Bell & Zoller Coal Co. mines, W. Kentucky and S. Illinois, where roof strata vary from soft shale to hard limestone, bolting is standard practice. Experiments at Ziegler No. 3 Mine using $3/4$ -in. expansion bolts and Chicago pneumatic drills are outlined. A fuller account is given in U.S. Bureau of Mines Information Circular No. 7633 (No. 224). At Oriole Mine, where the roof is very weak shale, timbers are sometimes used in conjunction with bolts (expansion type). Roof bolting machines, mobile, twin-boom, built on tractor chassis, are described.

234. BERRY, J.K.

Roof bolting with large mobile equipment.

Coal Mine Modern. Yearb. 1951 84-87.

Description with illustrations of a hydraulically-operated, wet-drilling, single-boom, mobile unit made at No. 3 Elkhorn seam, Consolidated Coal Co., Ky. The chassis is a former timbering machine.

235. LANIER, S.S. Jr.

Pinning roof with wood.

Coal Age 1950 55 (6) Jun 78-80.

Wooden pins, 2 5/8-in. diameter, 5 ft 4 in. long, of oak or hickory, have been used at Rio Verde Mine, Norton Coal Corp., Nortonville, Ky., since 1949. Method of installation in stratified shale and sandstone roof is described. Pins are also used to support crossbars.

236. SINIFF, L.D.

Roof bolting in Elkhorn No. 3 Seam. (Consolidation Coal Co., Ky.)

Coal Mining 1949 26 (12) Dec 13-15, 23-24, 27.

Due to the weak structure when supported on crossbars, seam loosens to heights where bars will not support it. Trials were carried out in 1948 and since, using split-wedge-type $\frac{3}{4}$ -in. and 5/8-in. bolts.

MICHIGAN

237. EDWARDS, R.W.

Ground support in bulk mining.

Mining Congr. J. 1957 43 (6) Jun 69-71, 79.

Rock bolting is one of the methods being tried at Inland Steel Co. iron mines in the Lake Superior district. It has been tried particularly in the slate areas and has been used only for the spalling type of heavy ground but not where there is ground flow or subsidence.

MISSOURI

238. THOMAS, E.M., BARRY, A.J., & METCALFE, A

Suspensions of roof support. Progress report No. 1.

U.S. Bur. Mines Inf. Circ. 1949 (7533) Sep 13p.

Describes equipment and various techniques employed in bolting, including practice at St. Joseph's Lead Co., Mo.

239. THOMAS, E.M., SEELING, C.H., PERZ, F., & HANSEN, M.V.
Control of roof and prevention of accidents from falls of rock and coal; suggested roof supports for use at faces in conjunction with mechanical loading.
U.S. Bur. Mines Inf. Circ. 1948 (7471) May 9p.
In this general outline of methods of support, a section deals with suspension supports used at St. Joseph's Lead Co., Mo.

240. WRIGEL, W.W.
Channel iron for roof control.
Eng. Mining J. 1943 144 (5) May 70-72.
Split-end-and-wedge bolts, 1-in. diameter, are used in conjunction with 4-in. channel irons to support roof between pillars at St. Joseph's Lead Co. Mines, Leadwood, Mo. Bolts are also used to strengthen crumbling pillars.

See also abstract

128 METCALFE: Roof suspension supports (St. Joseph's Lead Co., Mo.)

MONTANA

241. POLLISH, L. & BRECKENBRIDGE, R.N.
Rock bolting in metal mines of the Northwest.
Mining Eng. 1954 6 (7) Jul 709-15.
A general outline of rock bolting practice with examples from various mines in Northwest U.S.A. Reference is made to a guniting-rock bolting application at Anaconda Copper Mining Co., Butte Mine, Montana, in an exhaust air crosscut in 1939. The three types of rock in the Coeur d'Alene district (Sunshine Mining Co.) are (1) Pre-Cambrian, (2) igneous rock, (3) unconsolidated sand, gravel and silt of the Tertiary and Quarternary Ages. Bolts generally used are 1-in. slot-and-wedge and $\frac{3}{4}$ -in. expansion-shell type.
242. POLLISH, L. & SANDVIG, R.L.
Rock bolting experience in the Butte mines.
Mining Congr. J. 1952 38 (8) Aug 50-2; 123.
Rock bolting practice dates from 1939 and 1940 in the quartz monzonite or Butte granite at the Belmont mine. Procedures are outlined; bolts used are 1-in.-diameter, slot-and-wedge type. Pull testing is done with Continental Model ET-252 hydraulic roof bolt puller. Concludes that the bolt should key loose rock into a self-supporting structure; the idea of using the bolt to suspend rock is erroneous.

NEW MEXICO

243. MECHANIZATION

Roof bolting results in production gains.
Mechanization 1951 15 (3) Mar 93-4, 96.
Practices at Koehler Mine, St. Louis, Rocky Mountain & Pacific Coal Co., Colfax Co., New Mexico, are outlined. The roof consists of layers of coal and shale and is bolted with wedge-type bolts of 1-in. diameter, 5 ft long.

NEW YORK

244. ERNST, E. & RUNVIK, R.

Control of mine roof at Oakfield.
Mining Eng. 1957 9 (6) Jun 646-7.
At U.S. Gypsum Co. Mine, Oakfield, N.Y., a flat-lying vein of rock gypsum is mined by room-and-pillar method. Vein averages 4 ft thick and is 1200-1600 ft in mineable width. Overlying roof is 2-ft-thick disintegrated gypseous shale and fractured limestone. Arches are formed by bolting strata between pillars. Bolting equipment and installation are outlined. $\frac{3}{4}$ -in., expansion-shell, mild steel bolts are installed on 5-ft centres.

245. PIERCE, J.C.

Pinning up an adequate roof.
Compressed Air Mag. 1953 58 (5) May 128-30.
Application of rock bolting techniques in the New York tunnel. Wedge-type bolts and channels are used. Bolting equipment, mounted on a jumbo, is shown.

246. PLATT, D.H.

Roof bolting the Delaware aqueduct.
U.S. Bur. Mines Inf. Circ. 1952 (7652) Nov 9p.
Suspension roof support in this large-diameter tunnel in New York State was adopted in 1951. Various bolts were tested and a 1-in., split-rod-and-wedge type of bolt, 6 ft long, was made standard.

See also abstract

108 RABCEWICZ: Bolted support for tunnels. (New York tunnel)

NEVADA

247. MCINTYRE, E.S.

Combined Metals' roof bolting experience.
Mining Congr. J. 1952 38 (9) Sep 26-8.
Slotted-type bolts, 1-in. diameter, 6 ft long, are used at the Nevada

properties. In the limestone rock, bolting was not effective in stopes. Practice adopted was bolting steel beams to the back and supporting the ground between the beams with 2 by 12-ft wood lagging resting on flanges of steel beams.

OREGON

248. LANG, E.T.

Better bolting at lower cost.

Coal Age 1955 60 (4) Apr 58-63.

At Powhatan Mining Co., Powhatan Point, Oregon, numerous experiments were carried out. Expansion-type bolts ($\frac{3}{4}$ -in. diameter, 5-6 ft long), Pattin bolts with Palnuts, Ohio Brass expanders and steel plates, are used. Bolting patterns, costs, etc., are given.

PENNSYLVANIA

249. MECHANIZATION

Roof bolting through core drill holes.

Mechanization 1955 19 (12) Dec 60-1.

Bolting methods at Lancashire No. 20 Mine, Barnes & Tucker Co., Cambria Co., Pa., are described and illustrated. Expansion bolts of $\frac{3}{4}$ -in. diameter, 42 in. long, are used. Roof consists of layers of bone and coal.

250. BERRY, J.K.

Rotary drilling in sand rock for roof bolting.

Coal Mine Modern. Yearb. 1954 15-20.

Description and application of the Fletcher drill which has sufficient torque to eliminate the need of an impact wrench to tighten bolts. A Mine Safety Appliances dry dust collector is built into the drill. Drilling and bolting procedures at two South West Virginia collieries of Clinchfield Coal Corp. are outlined; the problem of bit wear is discussed.

251. VALERI, M. & FITZWATER, M.M.

Pneumatic drilling for roof bolting, using a central air compressor station.

Coal Mine Modern. Yearb. 1954 21-30.

Following an outline of bolting practice using wedge-type bolts to hold roof of soft drawslate coal and shale, at Buckeye Coal Co., Nemacolin, Pa., the installation and use of a 2600-cfm compressor for drilling and ventilation purposes is described. Diagrams show piping system.

252. VALERI, M. & FITZWATER, M.M.
Pneumatic drilling for roof bolting.
Mining Congr. J. 1954 40 (5) May 45-8.
Review of rock bolting practices at Nemacolin Mine of Buckeye Coal Mine, Pa., using 1-in. wedge-type bolts, 5-6 ft long. Details of pneumatic drilling using a portable compressor are given. Diagrams show pipe line layout. A more detailed article on this subject is available (No. 251).
253. COAL AGE
Concurrent roof bolting with continuous miner.
Coal Age 1954 59 (4) Apr 102-3.
By placing bolts in seam-roof while machines cut at face, former timbering delays are avoided. Expansion-shell bolts, $\frac{3}{4}$ in. in diameter, 5 ft long, are used at Warwick No. 2 Mine, Duquesne Light Co., Greensboro, Pa.
254. COOPER, E.R.
Increasing reserves through roof bolting.
Coal Mine Modern. Yearb. 1953 16-20.
Successful application in roadways at Vesta Coal Mines, Jones & Laughlin Steel Corp., Pa., is described. The shale and slate roof is supported by bolts and channels. The type of bolt is not specified.
255. HOOD, A.R.
Advantages and problems of roof bolting.
Coal Mining 1952 29 (2) Feb 14-5, 22.
Bolting practice in conjunction with timbering at Cedar Grove Mines, Duquesne Light Co., Pa., is adapted to 3 types of conditions: (1) 8-12-in., medium to soft, laminated shale overlain with up to 20 ft of soft sandy shale, overlain with 40-60 ft of heavy grain sandstone; (2) intermediate top of laminated carbonaceous shale up to 15 in. thick, overlain with dark shale 1-3 in. thick, for a distance of 5-15 ft, overlain in turn with conglomerate sandy shale; (3) soft clay streaked with shaly fireclay. Paper read at 65th Meeting of Coal Mining Institute of America.
256. CARLAND, A.
Operating experiences with roof bolting.
Coal Mining 1952 29 (1) Jan 9-11.
Experiences at Warwick Mine No. 2, Duquesne Light Co., Pa., using expansion-sleeve bolts, $\frac{3}{4}$ -in. diameter, 5 ft long, in conjunction with timbering. Paper read at 65th Meeting of Coal Mining Institute of America.

257. SLAGER, T.

Underground mushroom farm.

Compressed Air Mag. 1951 56 (5) May 119-22.

In this description of an abandoned limestone mine in Butler Co., W.Pa., used as a mushroom farm, bolting techniques, using $\frac{3}{4}$ -in., wedge-type Hubbard bolts, installed with Ingersoll Rand stopehammer drills, are described.

258. INGERSOLL, D.E.

Applications in pitching measures.

Coal Mine Modern. Yearb. 1950 25-30.

Bolting in the Porter Tunnel, Philadelphia & Reading Coal & Iron Co., Schuylkill Co., Pa., is described. This tunnel through shale and red sandstone is driven across strata dipping at an inclination of 70-85° and will be 4800 ft long. Split-and-wedge 1-in. bolts, $5\frac{1}{2}$ - $6\frac{1}{2}$ ft long, are used. Dust problem is eliminated by wet drilling.

259. PRICE, P.H.

Geologic considerations of roof support.

Mining Congr. J. 1949 35 (12) Dec 45-48.

A report of the Committee on Roof Action. Following a discussion of general geologic features and geologic phenomena in coal mines, roof characteristics of the Pittsburgh coal seams are discussed in relation to recommended bolting practices.

UTAH

260. MECHANIZATION

Variable factors determine roof bolting practice.

Mechanization 1956 20 (10) Oct 67-8.

First used in 1950, two-thirds of all roof support is now by bolting at Federal No. 1 Mine, Utah (?). The seam is overlain by normal, bedded strata of slate, coal and shale. One-in. wedge-type bolts, 60-80 in. long, are used on main entries and $\frac{3}{4}$ -in. expansion-type are being replaced by $\frac{5}{8}$ -in. higher-carbon (10-40) steel bolts. Practice is outlined.

261. COAL AGE

Top benching solves thick coal problem.

Coal Age 1954 59 (11) Nov 92-3.

At Kingmine, U.S. Fuel Co., Hiawatha, Utah, instead of developing the bottom and then taking top coal and pillars, the process has been reversed to provide for development in the top of the seam and partial pillaring, all accompanied by bolting. Slot-and-wedge bolts are used.

262. COAL AGE
Uphill continuous mining.
Coal Age 1952 57 (12) Dec 94-5.
Use of bolting in conjunction with continuous mining at Kaiser Steel Co. No. 1 mine, Sunnyside, Utah.
263. BOYD, B.
Roof bolting at the U.S. and Lark mine.
Mining Congr. J. 1952 38 (7) July 33-5, 47.
Discusses rock bolting experiments undertaken in 1950 at this mine in Bingham District, Utah. Bolts used are of 1-in. split-rod type in 4-6 ft lengths with wedge. Bolting was successful in drifts and raises but not in stopes because of asymmetrical syncline formation of the limestone quartzite sedimentary column. Costs are given.
264. KEENAN, A.M.
Roof bolt testing ground.
Mechanization 1952 16 (3) Mar 107, 109-10.
Practice at Sunnyside Mine No. 2, Kaiser Steel Corp., Utah, is outlined. Wedge-type bolts, 1-in. diameter, 6 ft long, are used to support shale roof. Applications include driving rooms, back entries, crosscuts, airways, etc. Commercial firms supplying equipment are listed.
265. PEPERAKIS, J.
Roof bolting at Sunnyside.
Coal Age 1950 55 (10) Oct 66-9.
Supporting weak shale roof at Sunnyside Mines, Kaiser Steel Corp., Utah, with bolts. Both $\frac{3}{4}$ -in. and 5/8-in. expansion-shell and 1-in. wedge types are used.

WEST VIRGINIA

266. TUDOR, B.
Roof support with continuous mining.
Mining Congr. J. 1957 43 (6) Jun 54-6, 68.
Bolting in conjunction with continuous mining at Compass No. 1 Mine, Clinchfield Coal Co., Barbour Co., W.Va., is described. Expansion-shell bolts, 5/8-in. diameter, 5 ft long, are used and approximately one bolt per foot in a 17 $\frac{1}{2}$ -ft-wide room is used on 4-ft centres. Installation details are given.

267. COAL AGE

Increasing roof bolting efficiency with truck-mounted drills.

Coal Age 1957 62 (4) Apr 74-5.

Advantages of using a machine consisting of two Chicago Pneumatic RBD drills mounted on a truck are discussed. At No. 15 coal mine, Omar Mining Co., Omar, W.Va., expansion-type bolts, 30 in. long, are used on 4-ft centres in the drawslate roof.

268. GREENWALD, E.H. & PRICE, V.

Methods and results with mine roof bolting.

Coal Mine Modern. Yearb. 1955 94-105; discussion 105-7.

Practice at Boone Co. Coal Corp. mines, Sharples, W.Va., is discussed with the following aspects being considered: superiority of rotary drilling; elimination of manual bolt tightening; trials and tests to improve drilling; use of Joy RBD parallel double-boom drills; combination bolting and timbering; correction of design weaknesses; experiments with wood bolts.

269. COAL AGE

Dry percussion roof-drilling successful in hard sandstone.

Coal Age 1955 60 (8) Aug 82-4.

Outlines advantages of using dry-type percussion drill, Holman Dry-ductor, in bolting operations at Lorado Coal Mining Co., Lorado, Logan Co. W.Va.

270. HUNTER, J.C.

Roof bolting experiences and results.

Coal Mine Modern. Yearb. 1953 21-4.

Successful bolting practice using expansion bolts and Cleveland stoper drills at Jane Ann No. 4 mine, Powellton Coal Co., Logan Co., W.Va., is described.

271. FLOWERS, A.E.

Successful roof bolting at Idamay.

Coal Age 1953 58 (10) Oct 74-9.

Expansion-shell bolts, $\frac{3}{4}$ -in. diameter, 5-8 ft long, have been adopted at Idamay, W.Va., for many applications: roadways, face (in conjunction with roof channels), pillar extraction, entries and main haulageway intersection (in conjunction with wire mesh and guniting). Roof is generally of laminated shale.

272. COAL AGE

Bolts conquer mean top.

Coal Age 1953 58 (6) Jun 89-91.

At Red Parrott Coal Co. No. 5 mine, Prenter, W.Va., bolts hold roof suspended from solid sandstone above. One-in. wedge-type mild steel bolts, 5-6 ft long, are used. Details of bolting patterns are given.

273. EDWARDS, J.H.
Bolting beats bad top.
Coal Age 1953 58 (1) Jan 94-9.
Roof at Stotesbury No. 8 mine, Eastern Gas & Fuel Associates, Raleigh Co., W.Va., is of laminated shale which in some places causes great difficulty. Use of 1-in. wedge-type bolts, 36 in. long, and channels has proved effective.
274. GILLEY, J.L.
Roof bolting in pillar recovery.
Coal Mine Modern. Yearb. 1952 25-33; discussion 33.
Applications of bolting in pillar extraction and in roadway support at five coal mines in W.Va. are briefly discussed.
275. SHUPE, D.B.
Overall economies of roof bolting.
Coal Mine Modern. Yearb. 1952 34-42.
Experiences at Pocahontas Nos. 3 and 4 coal beds, Eastern Gas & Fuel Associates, Kimball, W.Va., are outlined. At No. 3, the immediate roof is very weak shale and the main roof of stronger shale. Conventional bolting patterns, with 4-ft wedge-type bolts, are used. At No. 4, where roof pressure is unusually high, wedge-type bolts, 30-80 in. long with 80-in. channels, are used.
276. COAL AGE
Roof bolts up efficiency 50%.
Coal Age 1951 56 (9) Sep 86-8.
At Melville No. 11 mine, Hutchison Coal Co., Logan Co., W.Va., where the mine roof is weak (sandstone with immediate top of drawslate, black slate or laminated sandstone), bolting replaced timbering in 1949. Bolts are split-and-wedge type, 1-in. diameter, 46 in. long, made by Bethlehem Steel Co. Work cycle is outlined.
277. COAL AGE
Roof bolting for efficiency.
Coal Age 1950 55 (9) Sep 74-5.
At Boone Co. Coal Corp., Sharples, W.Va., both split-rod-and-wedge (1 in.) and expansion-shell ($\frac{3}{4}$ in.) bolts are used and wooden pins are being tested, so far with no positive results. Bolting was first used for the shale in 1949.
278. COAL AGE
Small bolts hold bad top.
Coal Age 1949 54 (9) Sep 92-4.
Expansion-shell-and-plug and wedge-type bolts, 5/8-in. diameter, are used in conjunction with cross bars at Christopher Coal Co. Mines, Monongalia Co., W.Va., where drawslate roof is difficult to hold.

WYOMING

279. BOWIE, R.F.

Special roof bolt applications. Bolts and metal lath replace conventional timber in unique shaft sinking experiment.

Mining Congr. J. 1954 40 (1) Jan 42-3.

Account of airshaft construction at Union Pacific Coal Co., Wyoming, using bolts, wire mesh and gunite in place of timbering and plaster. Depth of shaft is 241 ft. Costs show this method to be more expensive than either concrete or conventional timbering, due to the high cost of guniting. Costs could have been reduced by using rust preventive on bolts and plates instead of guniting. 2000 ft of rock tunnel has also been bolted.

280. ENGINEERING AND NEWS RECORD

Diversion tunnel driving without liners, Keyhole Dam, Wyoming.

Eng. News Record 1951 146 (20) 17 May 30-31.

Wedge-type, 1-in. bolts, 6 ft long, were used to support sandstone roof of tunnel at Keyhole Dam. Another application was bolting of the face of portal prior to initial round of blasting to avoid moving the portal back at least 10 ft, thus saving open-cut excavation.

2. BOOKS, REPORTS, AND STANDARDS

AMERICAN SOCIETY FOR TESTING MATERIALS

- Standard specification for structural steel for ships.
Standard A131-55.

ERDHEIM, B. & BERGMAN, S.C.A.

- Dragförsök med Bergbultar.
Sweden, Kungl. Fortifikationsförvaltningen Befastningsbyran
Forsknings - och Försökssektionem. (Date?)

FELLENIUS, B.

- (Rock bolting)
Sweden, Kungl. Järnvägsstyrelsen Bantenskabyran. (Date?)

INTERNATIONAL LABOUR OFFICE

- Safety in coal mines. Vol. 2. Legislation.
Geneva, I.L.O. 1955. (Studies & Reports, New Series. No. 33)

MORATH, F. & KIND, H.

- Redorgorelse för provdragnig av grundbultar, anbringade in s.k.
trasberg.
Stockholm, Kungl. Vattenfallstyrelsen, Stamlinjebyggnaderna. 1954.

NATIONAL COAL BOARD (U.K.)

- Roof bolts. Standard specification P131/1955.

SIXTH COMMONWEALTH MINING & METALLURGICAL CONGRESS. 1957.

- Mining in Canada.
Vancouver, B.C. The Congress. 1957. 597p. \$10.

SPRUTH, F.

- Streckenausbau in Stahl.
Essen, Verlag Glückauf. 1955. 220p. 18 DM.

INDEX OF SUBJECTS

- Applications ... 115.
airways ... 55, 121, 144, 183, 213, 214, 264, 279.
arched openings ... 90.
back ... 153
blasting ... 155, 280.
charging stations ... 145.
cliff faces ... 90, 202.
convergence detectors ... 215.
crosscuts ... 145, 159, 198, 241, 264.
cross gate ... 198.
dam construction ... 65, 202.
development ends ... 54.
drifts ... 141, 145, 165, 172, 193, 214, 263, 264.
entries ... 25, 260, 264, 271.
face ... 10, 46, 159, 168, 196, 213, 271.
floor ... 104, 165, 167, 193, 197.
gangways ... 141.
gate roads ... 8, 163, 198, 214, 271.
hanging wall ... 223.
haulage ways ... 90, 159, 173, 183, 193, 194, 195, 198, 213,
230, 254, 271, 274.
headings ... 55, 193.
intersections See gate roads.
large excavations ... 183, 191.
longwall workings ... 139, 143, 159, 191.
main loading gate ... 196.
manways ... 213.
pillar workings ... 88, 105, 135, 176, 182, 240, 244, 261, 271, 274.
pipe and cable support ... 191, 224.
pressure shaft ... 137.
raises ... 141, 263. See also airways; manways.
rippings ... 191.
roadheads ... 191, 198.
roadways See haulage ways.
shaft stations ... 141, 144, 145, 168, 183.
side walls ... 54, 90, 153, 183, 195.
stone drive ... 173.
stopes ... 54, 90, 141, 144, 168, 216, 223, 247.
timber storage area ... 145.
temporary shaft support ... 183.
tunnelling ... 81, 93, 98, 104, 108, 116, 221, 245, 246, 258,
279, 280.
undercutting ... 183.
underground rooms ... 137, 152, 191, 201, 213, 257, 264.
upbrows and downbrows in virgin land ... 165.
walls See side walls.

- Arch formation theory ... 3, 12, 15, 244.
Beam formation theory ... 3, 5, 8, 9, 12, 17, 128, 242.
Voussoir ... 4.
Bed movement See Rock movement; Testing-bed separation.
Bolt manufacture ... 43, 45, 104, 115, 135.
Bolt withdrawal ... 55, 164, 195.
Bolting patterns See Installation, design.
Bolts ... 99, 104, 106, 165, 196, 204.
 Ancrall ... 59, 172.
 anchor, early German type ... 62.
 Boltex ... 48, 57, 92, 172.
 cement ... 61, 64, 155, 156, 167, 174, 175, 195. See also
 Perfo tube.
 double expansion ... 224.
 drill steel ... 54.
 elastic casing ... 51.
 expansion-shell ... 20, 26, 29, 30, 34, 44, 50, 53, 99,
 111, 145, 159, 160, 162, 170, 199, 201, 213, 216, 227,
 228, 229, 231, 233, 241, 244, 248, 249, 253, 256, 260,
 265, 266, 267, 271, 277. See also specific types of
 expansion bolts.
 expansion-shell-and-plug ... 43, 123, 151, 199, 278.
 Foran expansion ... 148, 151.
 G.H.H. ... 48, 92.
 Gruppe lens design ... 159.
 hoisting rope See wire rope.
 Hubbard wedge ... 48, 57, 92, 172, 257.
 Lantern head expansion ... 39.
 parallel expansion (Victor Products) ... 52.
 Pattin ... 48, 248.
 Perfo tube ... 48, 65, 174, 177, 184, 186, 187.
 pierced rod ... 200.
 Ohio Brass expansion ... 172.
 Polish ... 55.
 Rawlbolts ... 17.
 rubber-sleeved ... 58. See also Foran.
 Russian ... 46.
 shear-zoned ... 47.
 slot-and-wedge ... 20, 26, 29, 30, 34, 44, 45, 48, 49, 50, 53,
 54, 60, 92, 97, 99, 101, 111, 131, 135, 141, 142, 143, 144,
 147, 151, 152, 153, 157, 159, 160, 168, 169, 170, 172, 173,
 175, 176, 179, 180, 182, 193, 196, 198, 199, 213, 214, 216,
 217, 218, 220, 221, 223, 225, 229, 230, 236, 240, 241, 242,
 243, 245, 246, 247, 251, 252, 258, 260, 261, 262, 264, 265,
 272, 273, 275, 276, 277, 278, 280. See also specific types
 of slot-and-wedge bolts.
 split-sleeve See wedge-and-sleeve.
 umbrella type ... 193.
 wedge See slot-and-wedge.
 wedge-and-sleeve ... 39, 60, 162, 169, 170, 172, 193.
 Werner ... 172.
 wire rope ... 54.
 wire rope and cement ... 56.
 wooden ... 61, 63, 181, 204, 222, 232, 235, 268, 277.

Compressive forces See Pressure.

Continuous mining ... 88, 112, 217, 253, 262, 266.

Costs

Australia ... 134.

Canada ... 99, 141, 142, 150, 151, 154.

France ... 115.

Germany ... 164, 165, 168.

New Zealand ... 173.

Sweden ... 187.

United Kingdom ... 17, 199.

United States ... 85, 86, 87, 105, 116, 121, 217, 220, 227,
229, 230, 248, 263, 279.

drilling ... 72.

Dimensional analysis ... 6.

Drilling equipment and techniques ... 44, 72, 75, 77, 101, 128,
165, 204, 231, 258.

Atlas Diesel equipment ... 142.

bolting machines, general ... 78, 225, 233, 234, 245, 267.

Chicago pneumatic ... 73, 233, 267.

Cleveland stoper drill ... 270.

Fletcher drill ... 250.

Holman dryductor ... 101, 269.

Ingersoll Rand stoperhammer ... 257.

Joy continuous mining equipment ... 217, 227.

Joy RBD parallel double boom ... 268.

pneumatic drills and compressors, general ... 251, 252, 269.

rotary drills ... 52, 71, 76, 131, 173, 234, 268.

Dust control ... 44, 74, 75, 77, 143, 204, 250, 258.

Königsborn dust exhaustor ... 80.

Elasticity of rock, theory ... 1, 16.

Equipment, auxiliary ...

channel irons ... 55, 90, 102, 115, 130, 137, 187, 195, 198,
214, 227, 236, 240, 245, 247, 254, 271, 273, 275.

bankbars and pages ... 201.

crossbars ... 225, 235, 236, 247, 278.

expanders (Ohio Brass) ... 248.

timber and other wood supports ... 90, 222, 224, 233, 247, 255,
256, 268.

triangular plates ... 41, 175, 187.

wire mesh ... 41, 90, 137, 175, 271, 279.

Equipment, general ... 38, 42, 91, 95, 110, 135, 138, 151, 198, 207,
226, 238, 244.

Experiments ... 13, 23, 132, 135, 138, 160, 161, 167, 168, 169, 177,
178, 197, 199, 237, 248, 263, 277.

model studies ... 5, 6, 7.

Barodynamic model studies ... 16.

using concrete beams ... 33.

- Geologic structure ... 14, 16, 169, 259.
 - argillite and quartzite ... 222.
 - Butte granite ... 242.
 - clay ... 14, 18, 255.
 - gritstone See sandstone.
 - igneous rock ... 241.
 - iron ore ... 109, 200, 213.
 - limestone ... 156, 233, 244, 247, 249, 257.
 - limestone and quartzite ... 263.
 - Pre-Cambrian rock ... 241.
 - plastic and semi-plastic rock ... 12.
 - potash ... 161, 166.
 - salt ... 162.
 - sandstone ... 14, 18, 25, 158, 173, 201, 212, 221, 235, 250, 255, 258, 269, 272, 276, 280.
 - schist ... 176, 177.
 - shale ... 14, 25, 54, 63, 131, 158, 160, 177, 188, 201, 212, 224, 226, 227, 232, 233, 235, 243, 244, 251, 254, 255, 258, 260, 265, 271, 275, 277.
 - slate ... 11, 237, 251, 254, 260, 267, 273, 276, 278.
 - talcosed greenstone and greywacke ... 56.
 - unconsolidated sand, gravel, silt ... 241.
 - unstable zones ... 108, 137, 174.
- History ... 17, 104, 111, 129, 170, 172, 205, 210. See also Reviews.
 - early applications
 - American ... 49, 128.
 - Dutch ... 18.
 - German ... 62, 170.
- Installation design ... 5, 6, 7, 8, 10, 15, 17, 63, 88, 89, 92, 99, 103, 110, 115, 141, 157, 158, 169, 172, 179, 191, 196, 198, 223, 231, 245, 248, 266, 268, 272.
 - length of bolt estimation ... 47.
 - standards of evaluation ... 37.
- Installation equipment and methods ... 54, 107, 110, 111, 122, 142, 159, 161, 170, 172, 175, 180, 182, 192, 244. See also Techniques; Equipment, auxiliary.
 - bolt tightener ... 42.
 - lubrication under head ... 125.
 - palnuts ... 127, 248.
 - rods with upset ears ... 127.
 - roof hole gauging instrument ... 44, 77.
