

Mines Branch Information Circular IC 267

EVALUATION OF CANADIAN COMMERCIAL COALS:
NOVA SCOTIA - 1970

by

T.E. Tibbetts* and W.J. Montgomery**

ABSTRACT

Physical and chemical analyses of fifty-two coal samples are reported, representing the operating mines in Nova Scotia.

The samples were taken and analysed by the Fuels Research Centre during the year 1970. They represent the production on a specified day of the coals as commercially prepared at the mine or the coals as delivered to thermal electric generating stations.

* Head, Coal and Peat Resources Evaluation Section and ** Head, Solid Fuels Laboratory, Fuels Research Centre, Mines Branch, Department of Energy, Mines and Resources, Ottawa, Canada.

Direction des mines

Circulaire d'information IC 267

EVALUATION DES HOUILLES COMMERCIALES CANADIENNES :

NOUVELLE-ÉCOSSE - 1970

par

T.E. Tibbetts* et W.J. Montgomery**

RESUME

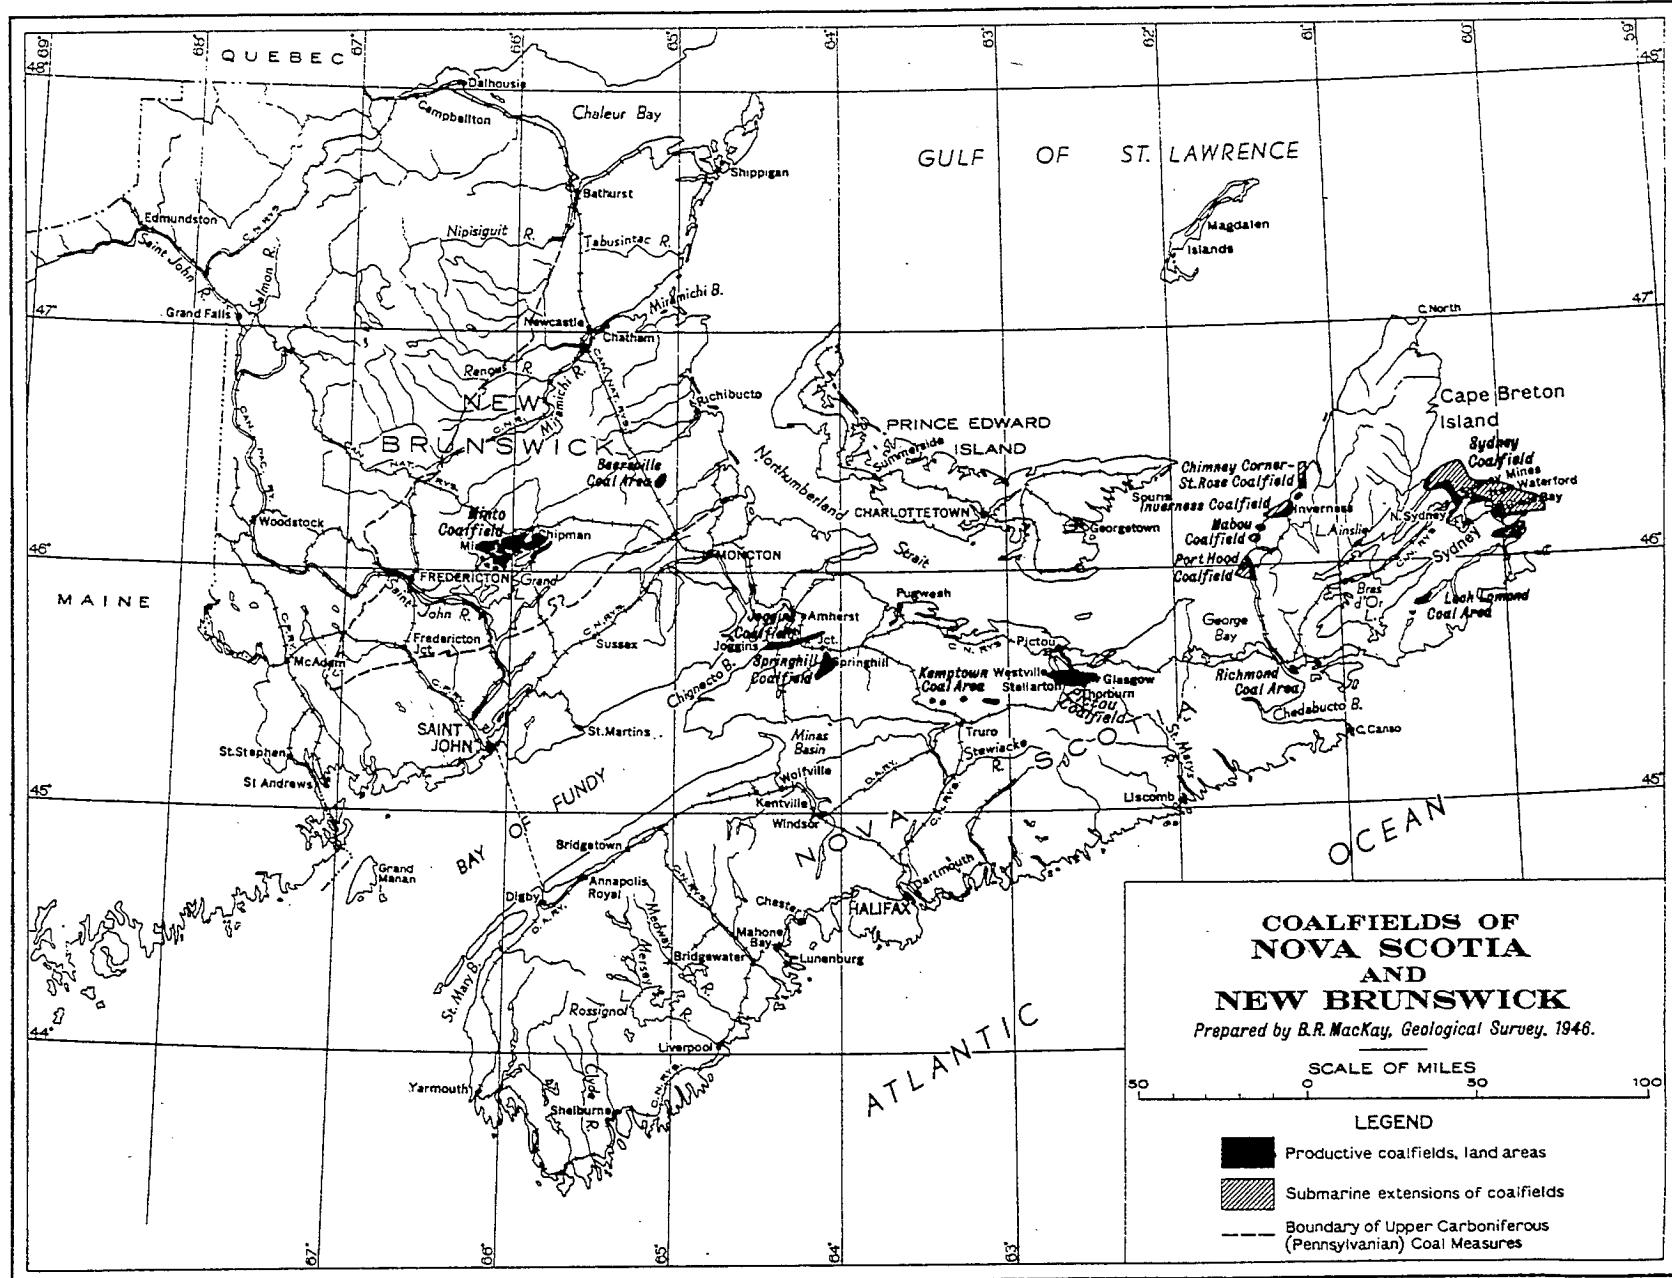

Les auteurs donnent les résultats des analyses chimiques et physiques de 52 échantillons de houille provenant des mines en exploitation en Nouvelle-Écosse.

Les échantillons ont été prélevés et analysés en 1970 par le Centre de recherche sur les combustibles. Ils sont représentatifs de la production journalière de la houille préparée commercialement à la mine ou livrée aux centrales thermiques.

* Chef, Section de l'évaluation des ressources en houille et en tourbe, et ** Chef, du Laboratoire des combustibles solides, Centre de recherche sur les combustibles, Direction des mines, Ministère de l'Energie, des Mines et des Ressources, Ottawa, Canada.

INTRODUCTION

In order to keep in close touch with any change in coal quality and to ensure that such changes are significant and not due to improper sampling techniques, the Fuels Research Centre has had members of the staff collecting samples of commercially prepared coals at the mines in eastern and western Canadian coalfields on a more or less continuing basis since 1954. The project (No. 2-2-9), "Survey of Canadian Commercial Coals", is conducted under the direction of the Coal and Peat Resources Evaluation Section and forms the basis of information on Canadian coals published periodically in the "Analysis Directory of Canadian Coals".

All samples collected under this project are obtained in accordance with recognized reliable specifications and for the most part are representative of the production for one day at the mines. Normal production and preparation procedures are followed at the mine during the sampling period, allowing the samples to be truly representative of the commercially prepared products. In certain instances, where it is recognized that more representative samples can be collected, sampling is conducted at thermal electric generating stations; where this is done it is so noted.

The gross samples were crushed and reduced in volume in the field prior to being shipped to Ottawa for analysis. A laboratory with complete sample preparation facilities was opened by the Fuels Research Centre at Glace Bay, Nova Scotia, in 1965. This was subsequently re-established in the Point Edward area, Sydney, Nova Scotia.

In order to report more accurately the total "as received" moisture of coals sampled in Nova Scotia, the loss of moisture on air drying was determined by standardized procedure at the Point Edward Laboratory prior to sample preparation. In certain instances where significant time lag was anticipated between the sampling period and sample preparation (crushing and volume reduction), and when practical in reference to particle size, special moisture samples were prepared from the gross sample at the time of sampling.

This publication contains the general analyses on the "as received" moisture basis of all commercial coal samples collected under this project during the year 1970 at mines and delivery points in Nova Scotia. It

also contains the ultimate analyses and ash analyses of selected samples, mainly the slack and fine sizes.

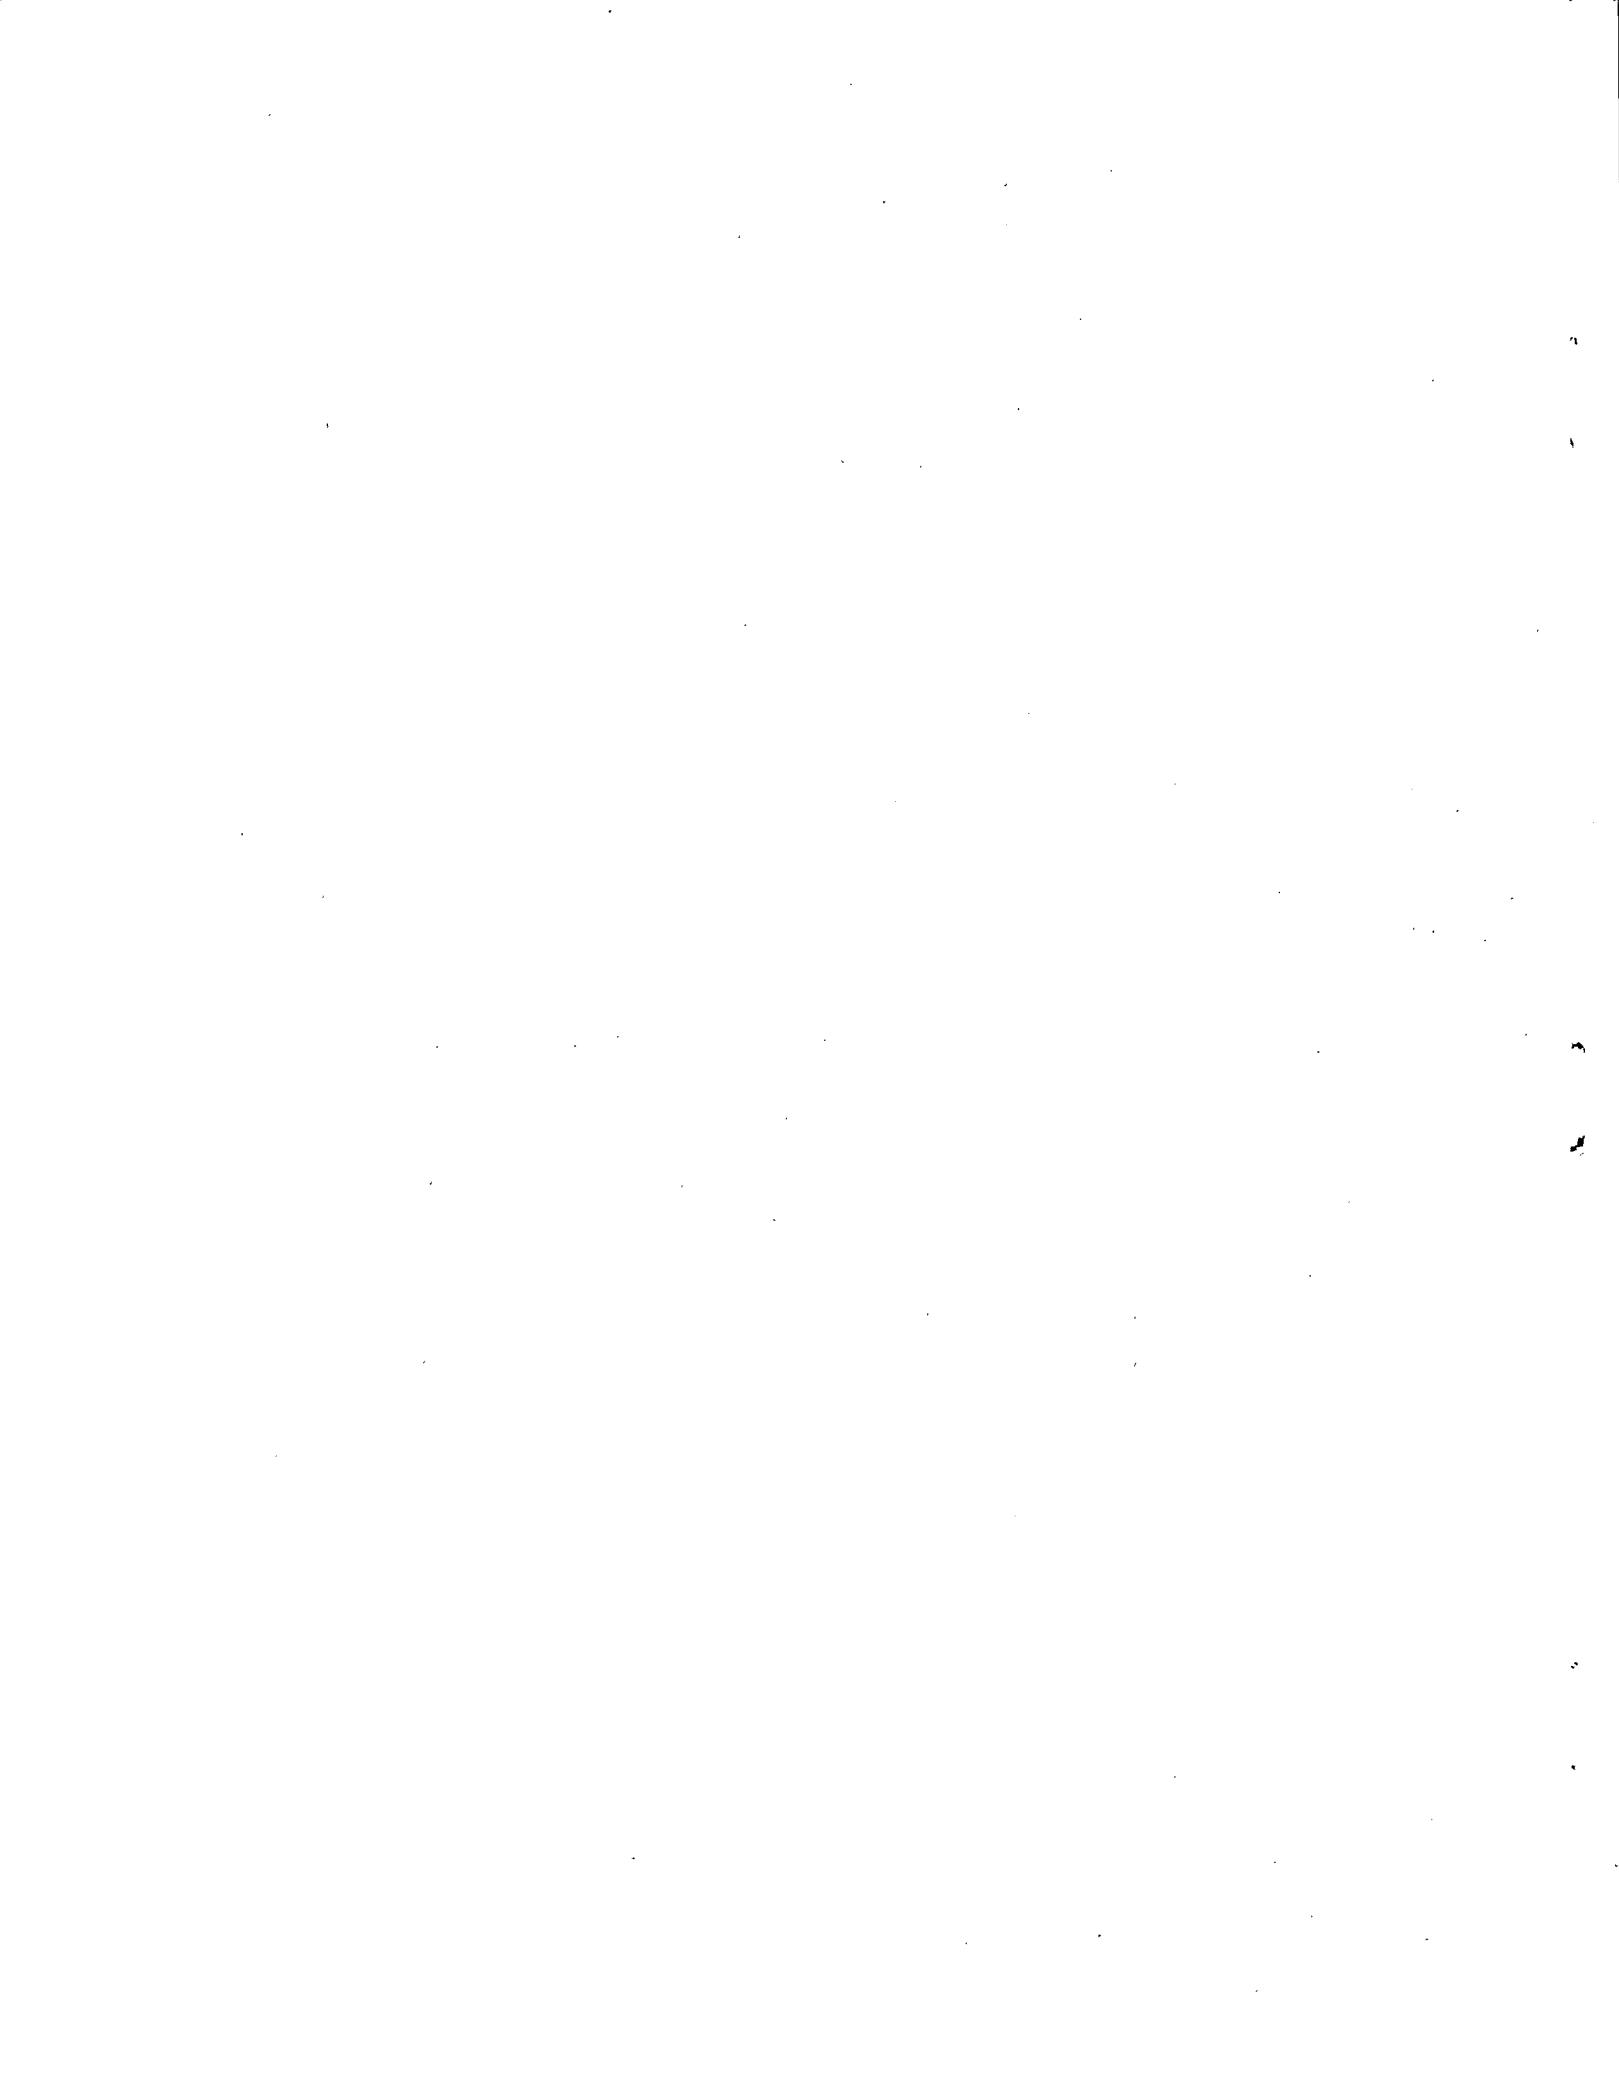

All analyses were conducted by the Fuels Research Centre. Analyses of coal samples collected in the Inverness coalfield are reported, because of the lower rank of this coal, on the equilibrium in-situ moisture basis. Ash fusion determinations are made in a reducing atmosphere.

The analyses are presented in two sections as follows:

- | | |
|------------|-----------------------------|
| Section I | - General Analyses |
| Section II | - Ultimate and Ash Analyses |
