ANALYSIS DIRECTORY OF CANADIAN COMMERCIAL COALS -
SUPPLEMENT NO. 6

by

G.W. Bonnell* and L.C. Janke**

SUMMARY

The assessment of Canadian commercial coals was undertaken by independently sampling run-of-mine and cleaned coals at operating mines, preparation plants and coal burning generating stations. Samples were taken by Coal Research Laboratories staff in Calgary, Alberta and Sydney, Nova Scotia during 1984, with the full cooperation of coal operators and users. Sample preparation and analyses were performed at the Energy Research Laboratories in Ottawa and Coal Research Laboratories in Sydney.

Generally, the samples represent production on a specific day, thus the results are broadly indicative, at least, for comparative and screening purposes, of the quality of Canadian commercial coals produced at the time of sampling.

Coals are identified by operator (not necessarily the lease owner), name of mine, seam, coalfield and location. Information is arranged by province and is intended to provide a ready indication of the quality of commercially available coals and to complement coal industry statistics available in other federal and provincial reports. If a more continuous profile of the quality of a specific coal is needed for commercial purposes, then the mine operator should, of course, be contacted.

Most major coal mines, coal preparation plants and coal burning generating stations in Canada were sampled.

*Supervising Chemist (Coal Testing Group), Cape Breton Coal Research Laboratory, CRL, Sydney and **Head, Solid Fuels Laboratory, ERL, Ottawa, CANMET, Energy, Mines and Resources Canada.

RÉPERTOIRE DES ANALYSES DES CHARBONS COMMERCIAUX CANADIENS
SUPPLÉMENT N° 6

par

G.W. Bonnell* et L. C. Janke**

SOMMAIRE

L'évaluation des charbons commerciaux canadiens a débuté par l'échantillonnage indépendant de charbons tout-venants et de charbons épurés provenant de mines en exploitation, d'installations de préparation et de centrales génératrices alimentées au charbon. En 1984, des échantillons ont été prélevés par les employés des Laboratoires de recherche sur le charbon à Calgary (Alberta) et Sydney (Nouvelle-Écosse) en coopération avec les exploitants et utilisateurs de charbon. La préparation et l'analyse des échantillons a été effectuées aux Laboratoires de recherche sur l'énergie à Ottawa et aux Laboratoires de recherche sur le charbon à Sydney.

En général, les échantillons sont représentatifs de la production d'une seule journée: par conséquent, les résultats sont en grande partie indicatifs, du moins à des fins de comparaison et de classement, de la qualité des charbons commerciaux canadiens produits au moment de l'échantillonnage.

Les charbons sont identifiés par exploitant (lequel n'est pas nécessairement propriétaire de la concession), par la mine, le gîte, la houillère et l'emplacement. Les renseignements sont classés par province et ont pour objet de fournir une indication immédiate de la qualité des charbons commerciaux canadiens disponibles et de compléter les statistiques sur l'industrie du charbon présentées dans d'autres rapports fédéraux et provinciaux. Pour obtenir des renseignements plus complets sur la qualité d'un charbon particulier, s'adresser à l'exploitant de la mine en question.

La plupart des principales houillères, installations de préparation de charbon et centrales génératrices alimentées au charbon au Canada ont été échantillonnées.

*Chimiste superviseur (Groupe d'étude sur le charbon), Laboratoire de recherche sur le charbon du Cap-Breton, LRC, Sydney et **Chef, Laboratoires des combustibles solides, LRE, Ottawa, CANMET, Énergie, Mines et Ressources Canada.

INTRODUCTION

CANMET has a national responsibility for assessing the quality and quantity of Canada's commercial coals. Files with chemical and physical data on coal date back to 1910. As well, CANMET (the former Mines Branch) has historically represented Canada's interest in national and international standards work in the subject area of coal and coke quality assessment. As a result there is a steady demand within Canada and from abroad for data and information on the quality of Canadian coals. These enquiries come mostly from potential users of Canadian coals and from various government departments requiring commercial coal quality information for inventory and regulatory purposes.

To meet these needs a series of CANMET reports are published as supplements to the "Analysis Directory of Canadian Commercial Coals". These reports have been published at various intervals since the original issue in 1948 (1,2,3,4,5,6). This supplement covers analyses of coals sampled by CANMET staff in Nova Scotia, New Brunswick, Saskatchewan, Alberta and British Columbia in 1984. All major coal producing sites were sampled, although not all saleable products could be sampled.

Individual data sheets for each sample provide a selection of chemical and physical characteristics and identify the samples with regard to their relevant coalfields, seams and mining districts. The information provides a better understanding of variations in coal quality within and between coalfields. The selected format makes it possible to relate this information to the statistical data and summaries of coal industry developments which appear in various publications and in certain federal and provincial coal reports dealing with production statistics and resource and reserve assessment (7,8,9,10).

Future presentations of analytical data on commercial coal may involve further changes in format that will provide more information consistent with developing concepts and establishing a national coal inventory for Canada. As well, more specific sample location data will be incorporated in future reports.

Sample collection was conducted by staff of the regional laboratories of CANMET's Coal Research Laboratories in Sydney, Nova Scotia and Calgary, Alberta with the cooperation and assistance of mine operators and

consumers. Normal mining and preparation plant sampling procedures were followed so that analytical results would be reasonably representative of production at the time of sampling.

Sample preparation facilities of the New Brunswick Electric Power Commission were used for partial preparation of samples from the Minto Coalfield in New Brunswick. Elsewhere, mobile and base facilities of the regional laboratories were used.

Sample preparation and analyses were conducted by qualified, experienced personnel at the Sydney and Ottawa laboratories using standard procedures of the American Society for Testing and Materials (ASTM). Although sampling procedures and analytical results of individual samples must be accorded a high degree of confidence, the frequency and timing of sampling and selection of samples from a variety of sources - seams, conveyors, mine sites, preparation plants and delivery points - mean that the data may only be subjected to statistical analyses with some reservations. It must be understood that individual sample results are not necessarily typical or representative of production over long periods and certainly should not be related to specific contract specification requirements. It is hoped that the chemical and physical information will be useful for purposes such as: considering quality aspects of contract specifications, classifying coal by rank, considering environmental hazards, selecting combustion or conversion processes and, to a limited extent, evaluating coal suitability for metallurgical use. The specific data and their usefulness are discussed briefly below.

The proximate analysis includes mass per cent of moisture, ash, volatile matter and fixed carbon. For low-, medium- and high-volatile A bituminous coals these determinations together with sulphur content and calorific value are presented on the basis of as-received moisture which is characteristically low. However, for high-volatile B and C bituminous, subbituminous and lignite coals, the proximate analysis, sulphur content and calorific value are presented on the basis of equilibrium moisture content.

The as-received moisture is the total of the moisture loss determined on air drying under standard conditions (adherent or surface moisture) and the residual moisture determined as part of the proximate analysis (inherent or oven dried moisture). On the other hand, the equilibrium

moisture provides a means of estimating the natural bed moisture exclusive of surface moisture and is essential for classifying low-rank coals.

Data on proximate analysis, sulphur content and calorific value are essential for establishing contract specifications and prices and for quality control of coal deliveries. The moisture, ash and sulphur contents and the calorific value are subject to improvement by appropriate coal preparation techniques used to upgrade the coal. The fixed carbon and volatile matter contents on a dry, mineral-matter-free basis, the heating values on a moisture, mineral-matter-free basis and along with the agglomerating characteristics are used for classifying coals by rank according to ASTM standards (Table 1).

The rank of the coal indicates the degree to which the original organic matter has been metamorphosed by temperature and pressure over time to form lignitic, subbituminous, bituminous or anthracitic coals. Rank is important commercially because, within wide limits, it signifies the potential use of the coal, subject to considerations related to quality factors such as moisture, ash, sulphur and trace element content.

The ultimate analysis presented on a dry basis includes mass per cent of carbon, hydrogen, sulphur, nitrogen, ash and oxygen, the latter obtained by difference from 100%. This elemental analysis is basic to the evaluations of coal for conversion and combustion uses.

The sulphur and trace element contents are important considerations related to power plant emissions and regional or national environmental pollution regulations. As well, sulphur is an unwanted constituent in the manufacture of coke for the metallurgical industry.

The values reported for the trace element analyses represent the total trace element concentration in raw coal as determined using the most recent version of the appropriate standard test method from volume 5.05 of the Annual Book of ASTM Standards. The range of concentration which these procedures cover and the expected variability in analytical results are described in the section on Precision and Bias in each test method. It should be cautioned that no attempt to predict the pathway of these elements in a combustion or conversion process from the bulk analytical results should be made.

Methods for determining arsenic and selenium in coal will soon be incorporated into the ASTM Book of Standards and subsequently can also be

incorporated into the Analysis Directory. ASTM standard methods for determining further trace elements are under development.

Sulphur forms reported in this publication are subdivided into three groups: pyritic sulphur, sulfate sulphur and organic sulphur. Sulphur forms are important considerations in coal washability and liquefaction.

Ash fusibility temperatures may be determined in a reducing or oxidizing atmosphere and are considered with selecting combustion equipment to avoid or reduce clinkering and slagging problems.

The mineral content of ash is important in furnace design as well as in the design of electrostatic precipitators. Mineral analysis of coal ash together with ash fusibility temperatures allow the prediction of slag viscosity. Mineral analysis of coal ash can also be used to predict the nature of fireside deposits formed in the boiler and characteristics of the fly ash such as electrical resistivity.

The Hardground Grindability Index is an indicator of the energy required to grind a coal to the desired fineness; the lower the index, the more energy required.

The ASTM Free Swelling Index (FSI) is an indicator of the swelling and caking characteristics of coal and is particularly relevant to selecting metallurgical coals.

The coal analyses are arranged by province. Each page contains a three-line heading stating where possible: -name of mine operator (not necessarily the lease owner), -name of mine, seam and coalfield, -mine location by place name, county or district as appropriate and province.

For coal mines in the plains of Saskatchewan and Alberta, locations are often identified in the surveyed municipal land location system by section, township, range and meridian. Mines in Alberta are also identified by numbers assigned by Alberta's Energy Resources Conservation Board.

The approximate annual coal production of the major mines in Canada, in thousands of tonnes, is shown in Table 2 for 1985. Statistics are arranged by province, coalfield and company.

UNITS OF MEASUREMENT

Units of measurement in this report are in the International System of Units (SI) as approved for official use by the Canadian Standards Association and Metric Commission Canada. These units have been adopted by the Mining Association of Canada and the Coal Association of Canada. To assist with the shift to metric units these two associations have published "Metric Practice Guide for the Canadian Mining and Metallurgical Industries", 1978. Listed below are some useful conversion factors along with SI prefixes.

Notes:

ACKNOWLEDGEMENTS

The authors gratefully acknowledge the assistance of their co-workers in the collection, preparation and analysis of the coal samples used in this report.

Sample collection was conducted by H.G. Naidu, D.J. O'Brien, V. Srajer and K. Karr in Saskatchewan, Alberta and British Columbia. Sample collection in Nova Scotia and New Brunswick was conducted by D.J. O'Brien, H.G. Naidu, G. Corbett, D. Young and G. Bonnell.

Sample preparation for the western coals were performed by T.A. Lloyd and K. Graham. Sample preparation for the eastern coals was conducted by G. Corbett, D. Young and G. Bonnell.

Sample analyses for the eastern coals were performed in both the Cape Breton Coal Research Laboratory in Sydney and the Energy Research Laboratories in Ottawa. (In the Sydney Laboratory the following analyses were done by G. Corbett, D. Young and G. Bonnell: proximates, total sulphurs, heating values and FSI's.) All the remaining analyses for the eastern coals were done in the Ottawa Laboratory. Analyses for the western coals were done entirely at the Energy Research Laboratories in Ottawa. Proximate analyses and FSI's were done by E. Bonvie. Ultimate analyses and equilibrium moistures were done by D. Rioux. Total sulphurs and sulphur forms were done by T. Psuika and J. Glasa. Heating values were done by J. Glasa. Hardgrove grindability indexes were done by K. Graham and T.A. Lloyd. F.P.A.'s and trace mercuries were done by H. Koethe. Ash analyses were done by T. Moher and P. Zourdos. Trace chlorine and fluorine analyses were done by J. Skulski.

Special thanks to H.G. Naidu and D.J. O'Brien for making sure proper sampling procedures were followed and for the collection of pertinent information necessary for this report. Special thanks to J. Glasa for keeping the authors supplied with analysis results as they became available. Special thanks to A.S. Romaniuk (project leader) who provided advice in putting this report together, and to H.G. Naidu and D.J. O'Brien for providing the raw coal production statistics.

Table 1 - Summary classification of coal by rank

VM*	FC*	Class	Group (rank)	<u>Calorific value**</u>	
				Btu/lb	MJ/kg
2	98 -		Meta - Anthracite		
8	92 -	Anthracitic ¹	Anthracite		
14	86		Semianthracite		
			Low-volatile		
22	78 -		bituminous		
			Medium-volatile		
			bituminous		
31	69 -	Bituminous ²	High-volatile A		
			bituminous	14 000	32.6
			High-volatile B		
			bituminous	13 000	30.2
			High-volatile C		
			bituminous	11 500	26.7
			Subbituminous A ³	10 500	24.4
		Subbituminous ⁴	Subbituminous B	9 500	22.1
			Subbituminous C	8 300	19.3
			Lignite A	6 300	14.7
		Lignite ⁴	Lignite B		

*Dry, mineral-matter-free basis; VM = Volatile matter; FC = Fixed carbon.

**Moist, mineral-matter-free basis.

¹Nonagglomerating; if agglomerating, classified as low-volatile bituminous.

²Commonly agglomerating.

³If agglomerating, classified as high-volatile C bituminous.

⁴Nonagglomerating.

PRINCIPAL COAL MINES IN CANADA, 1986

Scale 1: 35 000 000

Produced by the Surveys and Mapping Branch, Energy, Mines and Resources Canada.

INDEX FOR MAP

Nova Scotia

(bituminous coal)

1. Lingan Mine (Cape Breton Development Corporation)
Prince Mine (Cape Breton Development Corporation)
Point Aconi Pit (Novaco Ltd.)
2. St. Rose Mine (Evans Coal Mines Ltd.)

New Brunswick

(bituminous coal)

4. (Minto / Chipman Area Pits (N. B. Coal Ltd.)

Saskatchewan

(lignite coal)

5. Bientrait Mine (Bientrait Coal Co.)
Boundary Dam Mine (M & S Coal Co.)
Costello Mine (formerly Klimax Mine) (Manalta Coal Ltd.)
Utility Mine (Saskatchewan Power Corporation, with Manalta as operator)
6. Poplar River Mine (Manalta Coal Ltd.)

Alberta

(subbituminous coal)

7. Montgomery Mine (formerly Roselyn Mine) (Manalta Coal Ltd.)
8. Vesta Mine (Alberta Power Limited, with Manalta as operator)
Diplomat Mine (Foresburg Collieries Ltd.)
Paintearth Mine (Foresburg Collieries Ltd.)
9. Highvale Mine (TransAlta Utilities Corporation, with Manalta as operator)
Whitewood Mine (TransAlta Utilities Corporation, with Manalta as operator)

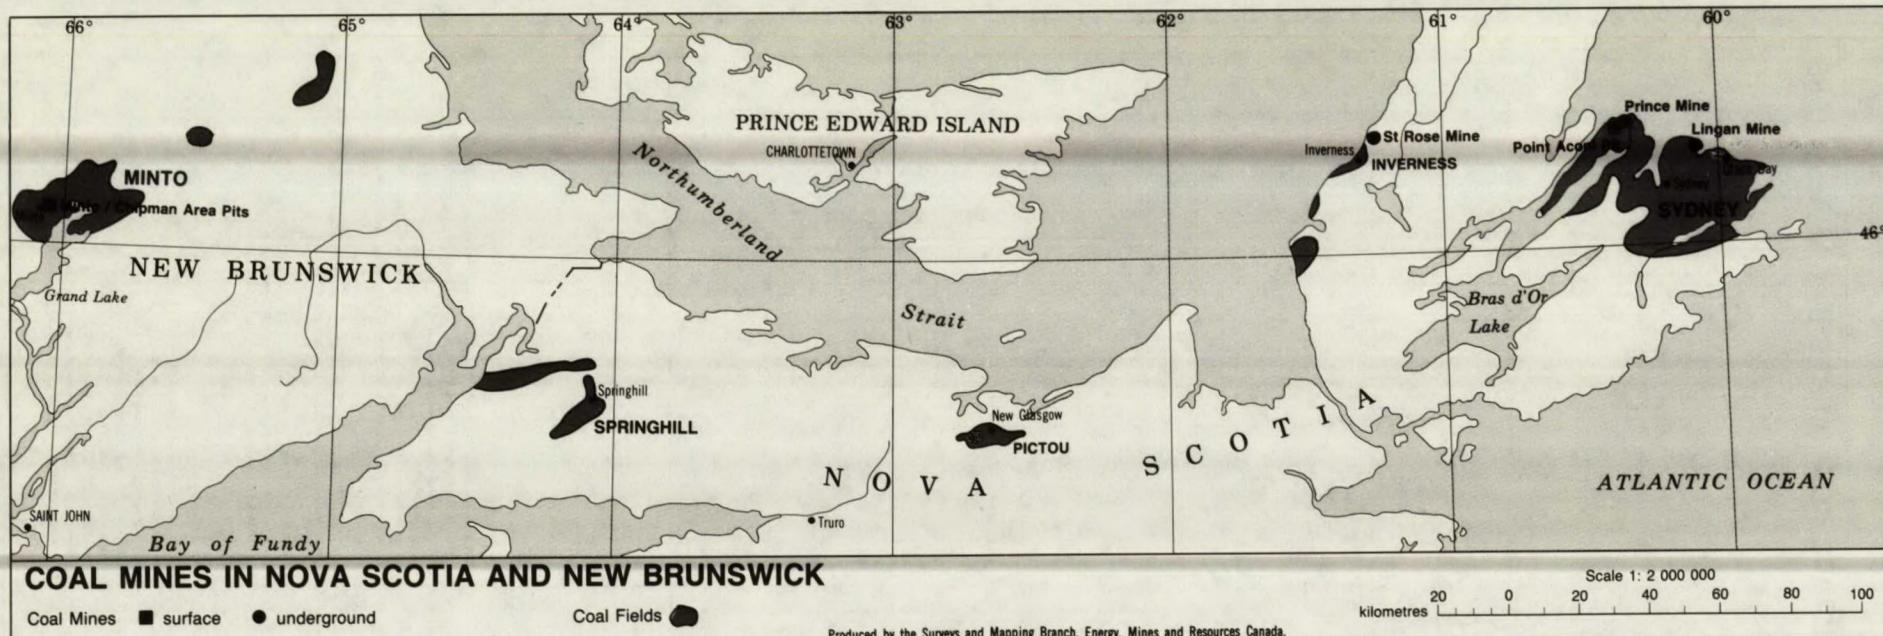

(bituminous coal)

10. Coal Valley Mine (Luscar Sterco Ltd.)
11. Luscar Mine (Cardinal River Coals Ltd.)
Gregg River Mine (Manalta Coal Ltd.)
12. Obed-Marsh Mine (Union Oil Company of Canada Limited)
13. No. 1765 Mine (underground) (Smoky River Coals Ltd.)
No. 1774 Mine (surface) (Smoky River Coals Ltd.)

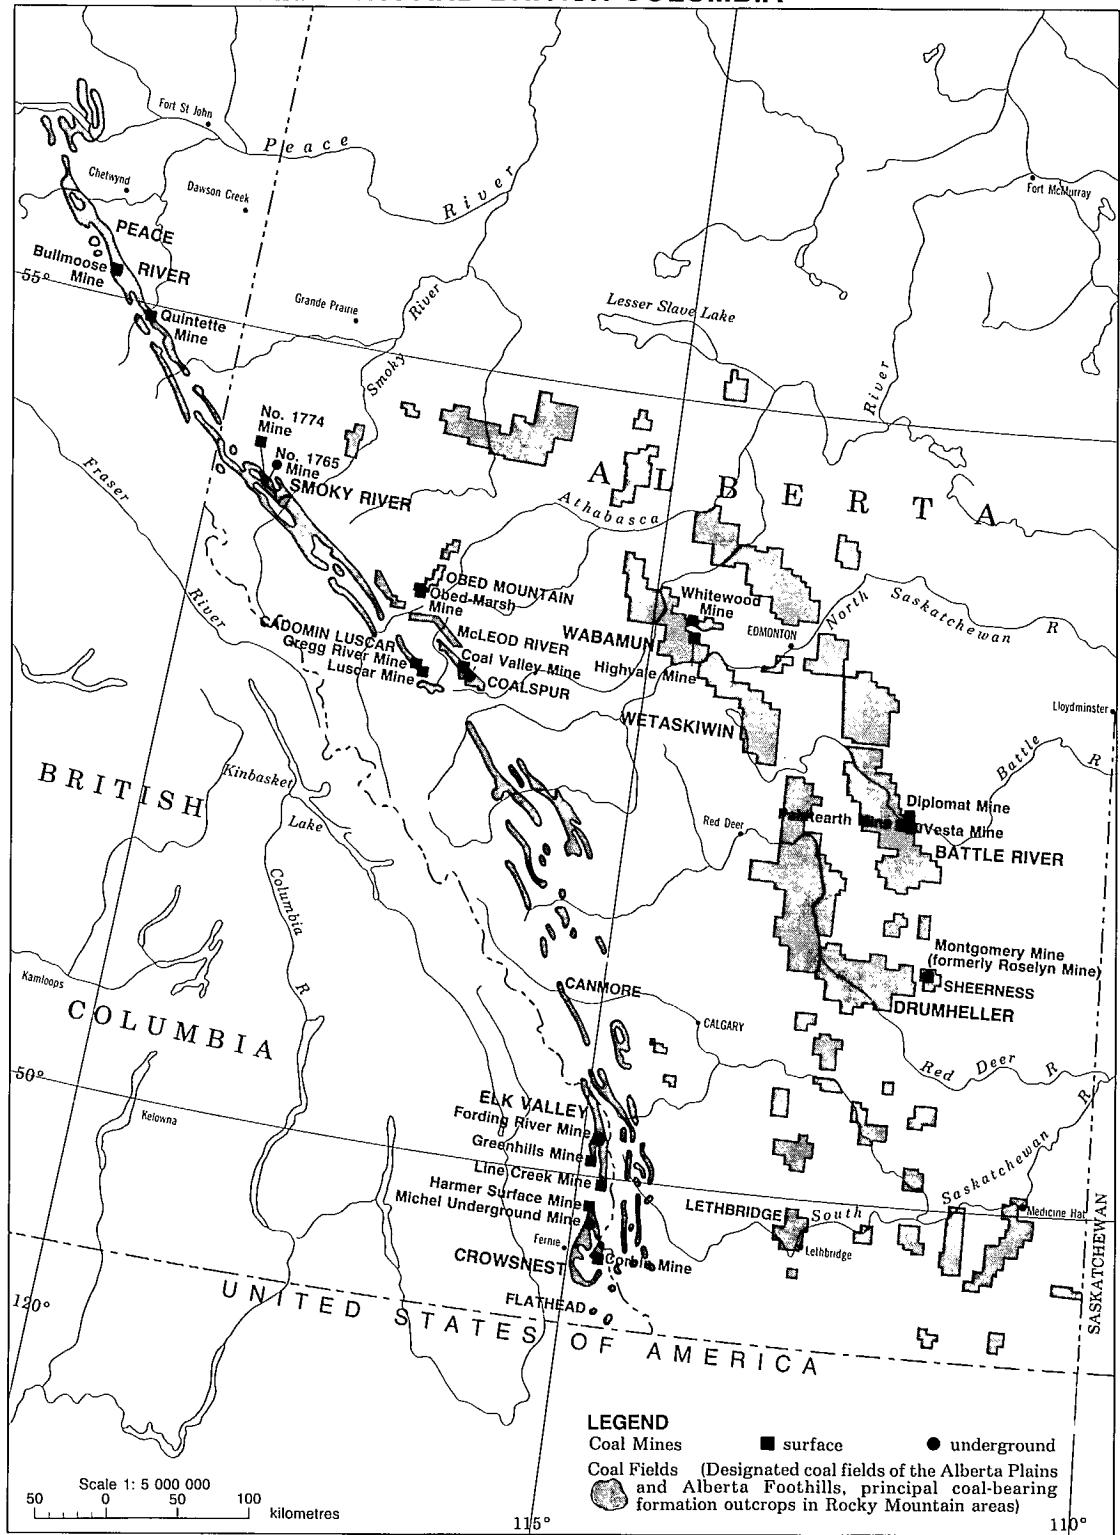

British Columbia

(bituminous coal)

14. Corbin Mine (Byron Creek Collieries Limited)
Harmer Surface Mine (Westar Mining Ltd.)
Michel Underground Mine (Westar Mining Ltd.)
15. Line Creek Mine (Crows Nest Resources Limited)
Fording River Mine (Fording Coal Ltd.)
Greenhills Mine (Westar Mining Ltd.)
16. Quintette Mine (Denison Mines Limited and others)
Bullmoose Mine (Teck Corporation and others)

COAL MINES IN ALBERTA AND BRITISH COLUMBIA

Produced by the Surveys and Mapping Branch, Energy, Mines and Resources Canada.
