REFERENCE MATERIALS CZN-1, CPB-1, CCU-1, MP-1a and MP-2:  
ADDITIONAL RECOMMENDED VALUES

by

Henry F. Steger\* and W.S. Bowman\*\*

SYNOPSIS

A second interlaboratory analytical program has been performed for reference materials CZN-1, CPB-1, CCU-1, MP-1a and MP-2 in order to assign recommended values for several elements which had not been sufficiently well characterized in the initial interlaboratory programs of 1978 to 1982. Ten laboratories under CANMET contract provided analytical results by methods of their choice. Based on a statistical analysis of the combined results of the present and initial programs, the following recommended values were assigned:

CZN-1: Bi, 27 µg/g; Sn, 65 µg/g; Se, 5.5 µg/g  
CPB-1: Mn, 0.039%; Sn, 0.019%; Se, 30 µg/g  
CCU-1: Fe, 30.87%; S, 35.4%; As, 41 µg/g; Se, 120 µg/g  
MP-1 : W, 0.040%  
MP-2 : Sn, 0.043%.

MATÉRIAUX DE RÉFÉRENCE CZN-1, CPB-1, CCU-1, MP-1a et MP-2:  
VALEURS RECOMMANDÉES ADDITIONNELLES

par

Henry F. Steger\* et W.S. Bowman\*\*

RÉSUMÉ

Une deuxième campagne analytique interlaboratoires a été élaborée afin d'assigner des valeurs recommandées à plusieurs éléments des matériaux de référence CZN-1, CPB-1, CCU-1, MP-1a et MP-2 dont la caractérisation était incomplète au terme de la campagne initiale de 1978 à 1982. Dix laboratoires ont obtenu des contrats de CANMET pour produire des résultats analytiques à l'aide de méthodes de leur choix. L'analyse statistique des résultats combinés de la campagne actuelle et de la campagne initiale a permis d'assigner les valeurs suivantes:

CZN-1: Bi, 27 µg/g; Sn, 65 µg/g; Se, 5,5 µg/g

CPB-1: Mn, 0,039 %; Sn, 0,019 %; Se, 30 µg/g

CCU-1: Fe, 30,87 %; S, 35,4 %; As, 41 µg/g; Se, 120 µg/g

MP-1 : W, 0,040 %

MP-2 : Sn, 0,043 %.

## INTRODUCTION

The Canadian Certified Reference Materials Project (CCRMP) endeavors to provide compositional reference ores, concentrates and related products typical of Canadian deposits and generally unavailable from other sources for use in analytical laboratories associated with mining, metallurgy and the earth sciences. These reference materials are described in a catalogue available from CANMET, Energy, Mines and Resources Canada, Ottawa (1).

From time to time, it occurs that one or more of the elements or constituents of concern in a particular reference material are not sufficiently well characterized by an interlaboratory analysis program to permit CCRMP to assign a recommended value for its (or their) content in that material. Only additional analytical results or another interlaboratory program can overcome this shortcoming. This report summarizes the results of a second interlaboratory program performed in 1983/84 for CZN-1 (2), CPB-1 (3), CCU-1 (4), MP-1a (5) and MP-2 (6) and of their combination with the results of the initial interlaboratory programs. This permits the assignment of recommended values for bismuth, tin and selenium in CZN-1; manganese, tin and selenium in CPB-1; iron, sulphur, arsenic and selenium in CCU-1; tungsten in MP-1a; and tin in MP-2.

## NATURE AND PREPARATION

The origin, physical preparation, chemical and mineralogical compositions and particle size distributions have been reported previously for CZN-1 (2), CPB-1 (3), CCU-1 (4), MP-1a (5) and MP-2 (6).

## INTERLABORATORY PROGRAM

Laboratories participating under CANMET contract in the interlaboratory program of 1983/84 are listed by laboratory number in Appendix A. They were requested to contribute five replicate results for the elements of interest on one bottle

of the reference material by a method of their choice and to report the results on an 'as is' basis. Where a laboratory reported two sets of results for an element, these sets were deemed to be statistically independent. The recommended values are given in Table 1. Methodological information for the present interlaboratory program is reported in Table 2. All available analytical information is summarized in Table 3; data from the present interlaboratory program are reported with the corresponding laboratory number.

## STATISTICAL TREATMENT OF ANALYTICAL RESULTS

### DETECTION OF OUTLIERS

Sets of results whose means differed by more than twice the overall standard deviation from the initially calculated mean value were not used in subsequent computations to avoid biasing the statistics. All results that were rejected are identified in Table 3.

### ESTIMATION OF CONSENSUS VALUES AND 95% CONFIDENCE LIMITS

A one-way analysis of variance technique was used to estimate the consensus value and variance. This approach considers the results of the described certification program to be only one sampling out of a universal set of results. The analytical data were assumed to fit the model (7).

$$x_{ij} = \mu + y_i + e_{ij}$$

where  $x_{ij}$  = the  $j^{\text{th}}$  result in set  $i$ ,

$\mu$  = the true consensus value,

$y_i$  = the discrepancy between the mean of the results in the set  $i$  ( $\bar{x}_i$ ) and  $\mu$ , and

$e_{ij}$  = the discrepancy between  $x_{ij}$  and  $\bar{x}_i$ .

It is assumed that both  $y_i$  and  $e_{ij}$  are normally distributed with means of zero and variances of  $\omega^2$  and  $\sigma^2$ , respectively. The significance of  $\omega^2$  is detected by comparing the ratio of between-set mean squares to within-set mean squares with the F statistic at the 95% confidence level and the appropriate degrees of freedom.

Table 1 - Recommended values and statistical parameters (outliers excluded)

Reference material	Element	No. of laboratories	No. of results	Overall mean	95% CL		$\sigma_A$
					Low	High	
CZN-1	Bi	17	148	27 $\mu\text{g/g}$	24	30	2
	Sn	14	103	65 $\mu\text{g/g}$	52	77	5
	Se	14	113	5.5 $\mu\text{g/g}$	4.5	6.6	0.6
CPB-1	Mn	22	187	0.039%	0.037	0.040	0.001
	Sn	13	93	0.019%	0.014	0.024	0.001
	Se	15	106	30 $\mu\text{g/g}$	27	32	1
CCU-1	Fe	10	70	30.87%	30.64	31.10	0.08
	S	13	90	35.4%	34.9	35.9	0.2
	As	20	156	41 $\mu\text{g/g}$	38	45	3
	Se	15	113	120 $\mu\text{g/g}$	111	129	5
MP-1a	W	20	100	0.040%	0.035	0.044	0.002
MP-2	Sn	12	65	0.043%	0.040	0.045	0.002

The consensus value of the assumed model is estimated by  $\bar{x}_{..}$  the mean of the mean of each set:

$$\bar{x}_{..} = \frac{\sum_i^k \bar{x}_i}{k}$$

where  $k$  = the number of sets.

The overall mean was calculated using individual laboratory mean values rather than individual values as is the usual practice in CCRMP because of the inequality in the number of replicate results from each laboratory provided in the initial and current interlaboratory programs for CZN-1, CPB-1 and CCU-1. Replication was ten and five, respectively, which would give the laboratories of the initial program twice the weighting of those of the current program in the calculation of overall mean values using individual results.

The value of  $\sigma^2$  is estimated by  $s_1^2$  which is given by

$$s_1^2 = \frac{\sum_i^k n_i \sum_j^k (x_{ij} - \bar{x}_{..})^2}{\sum_i^k n_i - k}$$

where  $n_i$  = the number of results set in  $i$ .

The value of  $\omega^2$  is estimated by

$$\omega^2 = \left( s_2^2 - s_1^2 \right) / \frac{1}{k-1} \left( \frac{k}{\sum_i^k n_i} - \frac{k}{\sum_i^k n_i^2} \right)$$

where

$$s_2^2 = \frac{\sum_i^k n_i (\bar{x}_i - \bar{x}_{..})^2}{k-1}$$

The variance of the overall mean is given by

$$V[\bar{x}_{..}] = \left( \frac{\sum_i^k n_i^2}{\sum_i^k n_i} / (\sum_i^k n_i)^2 \right) \omega^2 + \left( \frac{1}{\sum_i^k n_i} \sigma^2 \right)$$

and the 95% confidence limits for  $\bar{x}_{..}$  are

$$\bar{x}_{..} \pm t_{0.975, (k-1)} \sqrt{V[\bar{x}_{..}]}$$

It should be noted that 95% confidence limits denote that if the certification program were performed 100 times, the overall mean in 95 cases would fall within the prescribed limits.

The average within-set standard deviation,  $\sigma_A$ , is a measure of the average within-bottle precision as determined by the analytical methods used. The implication exists therefore that a laboratory using a method of average or better reproducibility should obtain individual results for a given certified element with a precision that is at least comparable to the reported value of  $\sigma_A$ .

Table 2a - Methodological information for CZN-1 and CPB-1

Element	Reference	Laboratory			Separation, decomposition, etc.
		material	number	Finish	
Bi	CZN-1		2,3,7,9	Atomic absorption	Mixed acid decomposition
			6,8	Atomic absorption (flameless)	Mixed acid decomposition; BiH <sub>4</sub> generation; quartz tube

## DISCUSSION

Table 4 is a summary of a methodological classification of accepted analytical results where there is a clear-cut distinction between types of methods in decomposition, separation and determination steps. No attempt was made to detect if there is a statistically significant difference between the overall means of the more popular methods.

The histograms of the analytical results for the various elements are shown in Fig. 1 and with the exception of bismuth in CZN-1 illustrate a good degree of consensus between participating laboratories. This fact is also demonstrated in Table 4 wherein the mean of all accepted results, as given by

$$\bar{x} = \frac{\sum_i^k \sum_j^{n_i} x_{ij}}{\sum_{j=1}^k n_i}$$

and the median value are compared. A significant difference in value is noted only for bismuth. An examination of Table 3a for bismuth points out there is a preponderance of results whose mean value lies below 40 µg/g; 17 out of 24 sets, excluding the obvious outlier at  $\bar{x}_i = 601.2$  µg/g.

The overall mean value (i.e., mean of individual laboratory means) of these 17 sets is

Table 4 - Overall mean and median values

Reference material	Element	Overall mean	Median
CZN-1	Bi	38 µg/g	27 µg/g
	Sn	70 µg/g	71 µg/g
	Se	5.3 µg/g	5.0 µg/g
CPB-1	Mn	0.039%	0.040%
	Sn	0.020%	0.020%
	Se	30.3 µg/g	30.5 µg/g
CCU-1	Fe	30.85%	30.84%
	S	35.5%	35.7%
	As	41 µg/g	42 µg/g
MP-1a	Se	120 µg/g	124 µg/g
	W	0.040%	0.041%
	Sn	0.043%	0.043%

27.4 µg/g, which is in excellent accord with the median found for all accepted results. The authors conclude therefore that a value of 27 µg/g is a better estimate of the bismuth content of CZN-1 than the overall mean value of all accepted results, i.e.,  $\bar{x}_i = 39$  µg/g and propose a recommended value of 27 µg/g for bismuth in CZN-1.

No attempt was made to assess the combined results of the initial and current inter-laboratory programs according to the criteria for certification employed by CCRMP (9). It was considered unwarranted to do so because of differences in the organization of the two programs.
