Abstract

This new surficial geology map product represents the conversion of Preliminary Map 7-1981 (Thomas and Dyke, 1982) and its legend, using the Geological Survey of Canada's Surficial Data Model (SDM version 2.3.14) (Deblonde et al., 2018). All geoscience knowledge and information from Preliminary Map 7-1981 that conformed to the current SDM were maintained during the conversion process. The purpose of converting legacy map data to a common science language and common legend is to enable and facilitate the efficient digital compilation, interpretation, management, and dissemination of geological map information in a structured and consistent manner. This provides an effective knowledge-management tool designed around a geodatabase that can expand, following the type of information to appear on new surficial geology maps.

Résumé

Ce nouveau produit cartographique de la géologie des formations superficielles correspond à la conversion de la Carte préliminaire 7-1981 (Thomas et Dyke, 1982) et de sa légende, en se servant du Modèle de données pour les formations superficielles (MDFS version 2.3.14) de la Commission géologique du Canada (Deblonde et al., 2018). Toutes les connaissances et l'information de nature géoscientifique de la Carte préliminaire 7-1981 qui sont en conformité avec le modèle de données ont été conservées pendant le processus de conversion. Le but de la conversion de cartes publiées antérieurement suivant un langage scientifique commun et une légende commune est de permettre et de faciliter la compilation, l'interprétation, la gestion et la diffusion efficaces de l'information géologique cartographique en mode numérique de façon structurée et cohérente. Cette façon de faire offre un outil efficace de gestion des connaissances élaboré à l'aide d'une géodatabase qui pourra évoluer suivant le type d'information à paraître sur les nouvelles cartes de la géologie des formations superficielles.

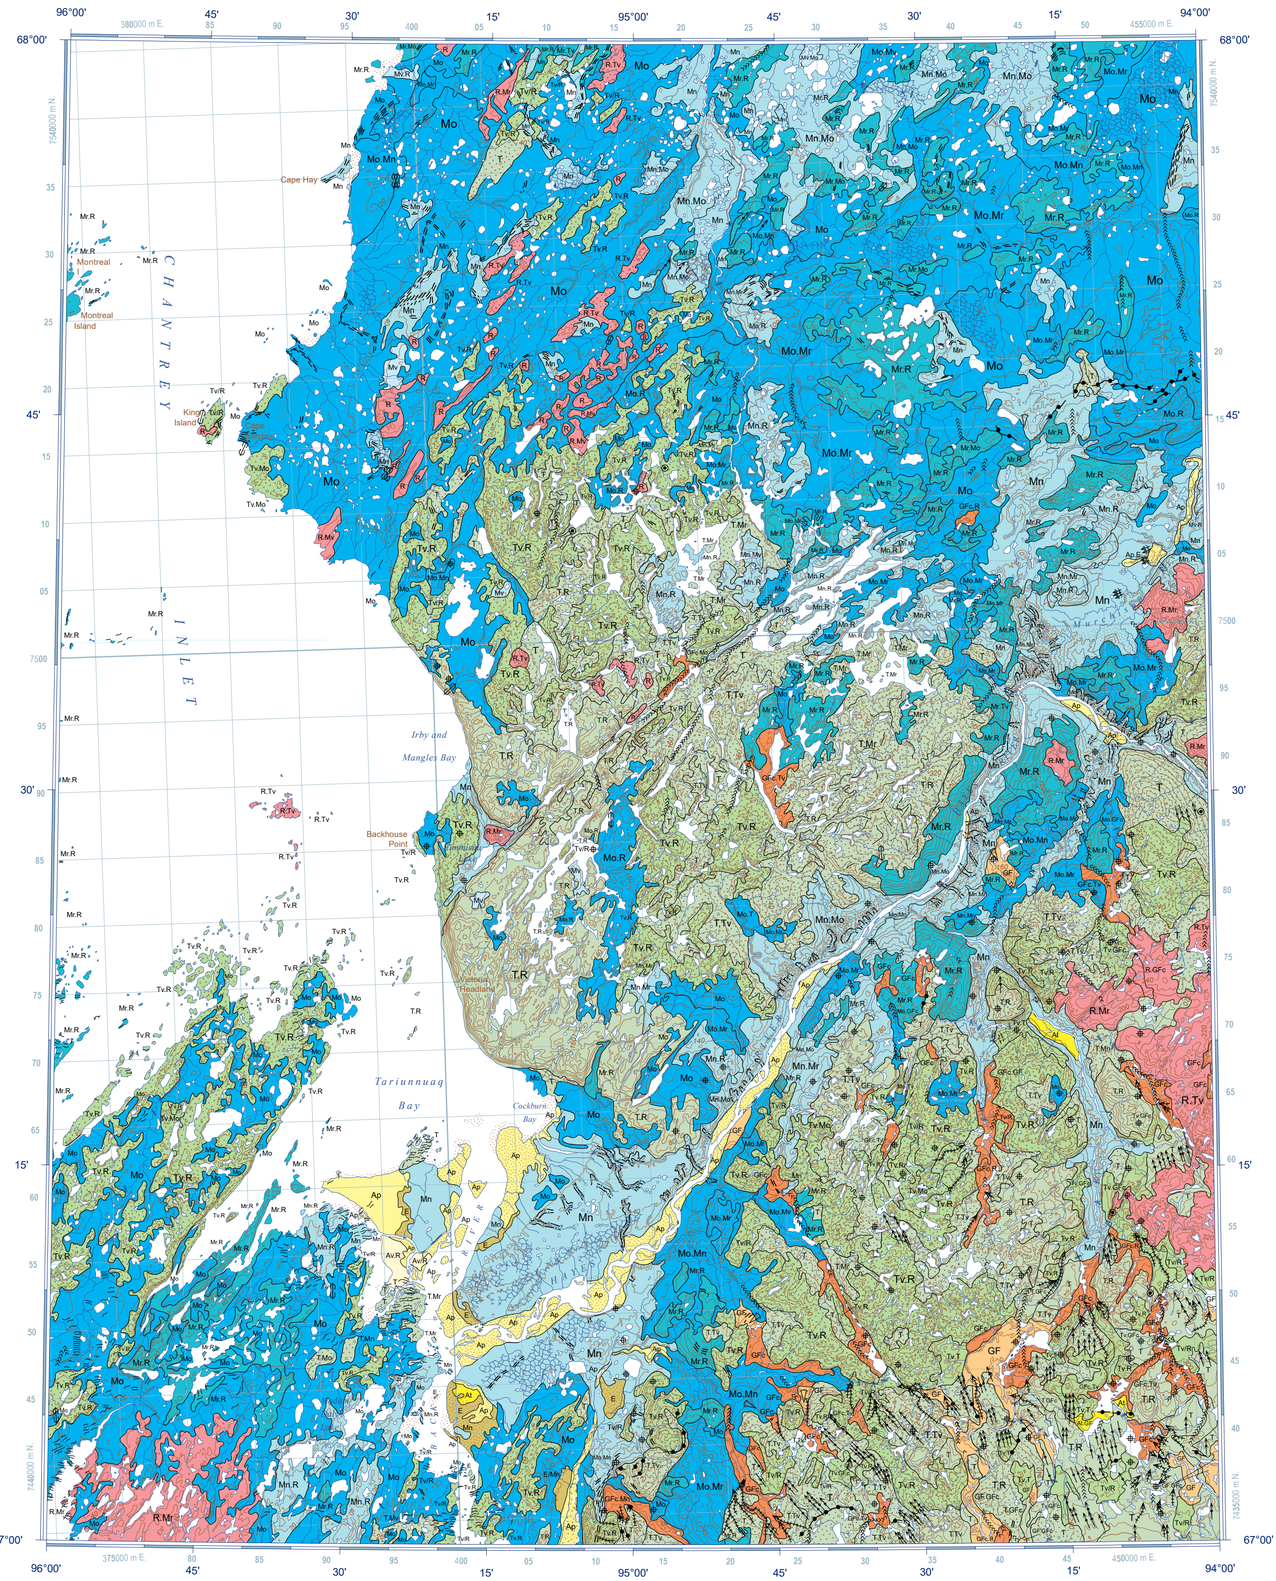
SURFICIAL GEOLOGY

LOWER HAYES RIVER

Nunavut

NTS 56-M

1:250 000



QUATERNARY

POST LAST GLACIATION

NONGLACIAL ENVIRONMENT

EOLIAN SEDIMENTS: silt and fine sand, moderately sorted and laminated, in places with cross-stratification, ripple marks, and finely disseminated organic material; less than 2 m thick; deposits too small to be mapped are generally included with units Ap, At, GFc, and GF.

E — **Eolian sediments, undifferentiated:** silt and fine sand; less than 2 m thick; unvegetated; presently active.

ALLUVIAL SEDIMENTS: silt, sand, and fine gravel; moderately to well sorted but commonly interstratified with beds of distinctly different grain sizes; crossbedding, scour-and-fill structures, and ripple marks common; up to 5 m thick.

Ap — **Floodplain sediments:** silt, sand, and gravel; variable thickness; seasonally flooded, unvegetated.

At — **Alluvial terraced sediments:** silt, sand, and gravel; variable thickness; above present flood zone, vegetated.

Av — **Alluvial veneer:** silt, sand, and fine gravel; commonly less than 1 m thick; overlying bedrock.

LAST GLACIATION

PROGLACIAL AND GLACIAL ENVIRONMENT

MARINE SEDIMENTS: silt, sand, and in places clay or gravel; generally less than 10 m but up to 75 m thick; deposited in high stand of the sea during glacial retreat.

Mr — **Beach sediments:** sand and silt or gravel, horizontal and cross-stratified; commonly less than 1 m thick; occurs as beaches overlying bedrock.

Mn — **Littoral and nearshore sediments:** sand and silt or gravel, horizontal and cross-stratified; from 2 m to a few metres thick; occurs as beaches and terraces; may locally overlie bedrock.

Mo — **Offshore sediments:** silt and clay, commonly rhythmically bedded; generally less than 10 m but up to 75 m thick; deposited in deep-water environments.

Mv — **Glaciomarine veneer:** silt, sand, and in places clay or gravel; commonly less than 1 m thick; deposited in deep-water environments; overlying bedrock.

GLACIOFLUVIAL SEDIMENTS: sand and gravel deposited in, or around, or near a glacier, largely as a result of meltwater stream flow.

GFc — **Ice-contact sediments:** sand and gravel, irregular to cross-stratified with poor to moderate sorting; up to 30 m thick; occurs as ice-contact deltas, sinuous ridges, isolated hummocks, local blanket deposits, and esker and kame complexes; may locally overlie bedrock.

GF — **Glaciofluvial sediments, undifferentiated:** sand and gravel, massive to well stratified and sorted; up to 70 m thick; with smooth, flat to inclined surfaces; occurs as deltas, fans, or terraced valley-fill deposits.

GLACIAL ENVIRONMENT

GLACIAL SEDIMENTS (TILL): poorly sorted till (diamicton) deposited directly by glacial ice.

Tv — **Till veneer:** silty, gravelly sand (diamicton) with less than 10% clay, nonsorted, nonstratified; commonly less than 1 m thick overlying bedrock; boulders common on the surface; occurs as veneer on underlying bedrock or as thin hummocks and ridges (moraines); where washed scoured lag overlay is present, the upper metre is abnormally sandy due to either removal of fines by wave action or intermixing of marine, glaciolacustrine, or glaciofluvial sand.

T — **Till, undifferentiated:** silty, gravelly sand (diamicton) with less than 10% clay, nonsorted, nonstratified, compact but unlithified; generally 7 m up to 20 m thick; boulders up to 2 m long common on the surface; occurs mainly as blanket on underlying bedrock or as hummocks and ridges (moraines); where washed scoured lag overlay is present, the upper metre is abnormally sandy due to either removal of fines by wave action or intermixing of marine, glaciolacustrine, or glaciofluvial sand.

PRE-QUATERNARY

R — **Bedrock, undifferentiated:** Precambrian igneous and metamorphic crystalline rock of variable composition and structure.

Complex units: two map-unit designators separated by a dot (.) are used where the surficial cover forms a complex area and the units are too small to be mapped individually (e.g. Tv.GFc designates an area of till veneer with numerous patches of ice-contact sediments).

Stratigraphic relationship: two map-unit designators separated by a slash (/) are used where a stratigraphic relationship is observed or confidently inferred (e.g. Tv/R designates till veneer overlying bedrock).

- Area of reworked sediments
- Kettle
- Geological contact, defined
- Direction of recent eolian movement of sand
- Ravine scarp
- Beach crest
- Meltwater channel:
  - Minor, paleocurrent direction unknown
  - Minor, paleocurrent direction known
- Moraine ridge:
  - Minor
  - Major unspecified
- Esker, paleocurrent direction known
- Drumlinoid, length not mapped to scale
- Crag-and-tail, length not mapped to scale
- Delta, paleocurrent direction known
- Striation:
  - Ice-flow direction unknown
  - Ice-flow direction known
- Shallow drillhole location
- Station location:
  - Remote observation
  - Ground observation
