ORBIT OF THE SPECTROSCOPIC BINARY 32 θ^2 CYGNI

BY J. B. CANNON, M.A.

32 θ^2 Cygni ($\alpha=20^h 12^m$, $\delta=+47^\circ 24'$, mag. 5.15, type G5) was announced a binary in *L. O. B.* 4, p. 96, from four measures giving a range of 30 km. Later in *A. N.* 4750, Küstner published three measures of plates taken in 1908, 1909 and 1911, having a range of 40 km. The star was under observation here during the years 1914, 1915, 1916 and 1917, during which time 117 plates were taken.

The following determination of the elements must be considered as preliminary. The period being so long—1170 days—the measures were only beginning to repeat themselves at the end of the fourth year. More observations several years hence may change the period by some days but the other elements, as determined, are probably fairly accurate. Five plates taken in 1908 helped in the determination of the period.

The wave-lengths of the lines used are given in Table I. Table IV contains the observations,—number of the plate, date, phase, velocity, and residual.

A curve running through the normal places has some similarity to that which would be given by the blending of the lines of the primary star by those of a secondary star, but the deviation from the elliptic form takes place unsymmetrically in such a way as to be hardly thus accountable. Also, there seems to be no widening of the lines at any place in the orbit and it seems as though the irregularities in the curve are due to actual variations in the motion of the light-giving body. It was therefore attempted to run an elliptical curve, as closely as possible, through the normal places and apply a secondary correction to this by introducing a circular curve of one-third the period.

A least-squares solution was carried through, which resulted in slight corrections to the elements and a reduction of the value of Σpvv from 75 to 60. The preliminary and final values of the elements are given below. Probable errors were computed and are appended to the final values.

Element	Preliminary	Final
P	1170 days.....	1170 days
e	0.2.....	0.182 ±0.053
ω	280°.....	281°.05 ±4°.8
K	16 km.....	16.64 km. ±0.93 km.
T	2,420,700.25 J.D.....	2,420,700.39 J.D. ±18.7 d.
γ	-14.6 km.....	-14.35 km. ±0.65 km.
K_1	6 km.....	5.86 km. ±0.90 km.
T_1	2,420,515 J.D.....	2,420,515.821 J.D. ±12.4 d.
$a \sin i$		263,250,000 km.
$\frac{m_1^3 \sin^3 i}{(m_1 + m)^3}$		0.53 ☉

To explain the curves one would have to consider the system as consisting of a light-giving body revolving about another body in a circular orbit in 390 days and these two about a third in an elliptic orbit in 1170 days (fig. 2).

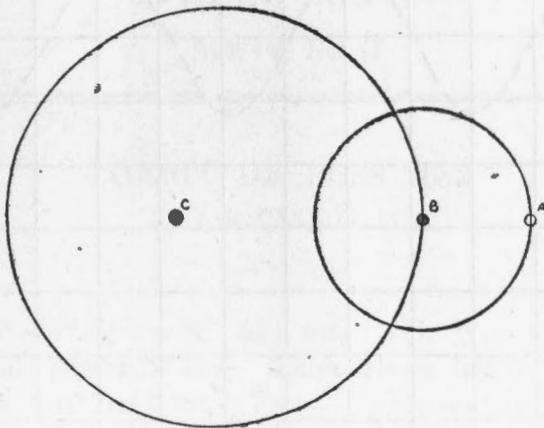

Fig. 2

In fig. 1 the single circles represent the Ottawa normal places, the double circles Küstner's observations, and the triple circles the Lick observations.
