

**Figure 18.** Location of sample 16SUV023. **A)** Prominent Beaufort Formation peneplain gravelled surface outlined by red dashed line (0.4 x 2.0 km). View to southwest. Absence of ice wedge polygons points to coarse nature of deposit in comparison to adjacent finer Eureka Sound Formation strata. **B)** Pebble-gravel surface exhibiting orange-oxidized, rounded quartzite, and dominant sub-rounded to sub-angular black and grey chert, with lesser tan, green, and red chert; clast sizes average 1-3 cm diameter. **C)** Looking north along peneplain surface from sample site. Note absence of glacial erratic cobbles or boulders, and conspicuous bright orange-colour.
