

Figure 12. Ni-in-garnet geothermometry (Ryan et al., 1996) for GSC Banks Island Cr-pyrope garnets (n=61) between 450 and 1800°C. G9 garnets are unlabelled, all others are as indicated. Dark line is the relative probability curve of the distribution. Diamond stability window typically sits between 900 and 1200°C.
