

**Figure 6.** Flow chart illustrating the processing steps of glacial sediment samples for indicator minerals as per GSC protocols (adapted from Plouffe et al., 2013; McClenaghan et al. 2013, in press). Samples targeted for KIM recovery are passed twice across the shaking table. While the <0.25 mm sample is generally not picked for KIMs, several samples from Beaufort Formation deposits had this step added to capture more of the total KIM population.
