ABSTRACT

The joint Natural Resources Canada/Department of Fisheries and Oceans Marine Spatial Planning Program requires the highest resolution bathymetric elevation data and adjacent land-based topographic elevation data that are available. This digital elevation model of Canada's west coast compiles the best data available from multiple government agencies to create a regional model gridded at 10 metre spacing. The transitions between the marine and terrestrial areas are near-seamless creating a surface of elevations for non-navigational scientific research, cartographic, and general marine spatial planning use.

The product is available on the Federal Geospatial Platform at:

<https://open.canada.ca/data/en/dataset/e6e11b99-f0cc-44f7-f5eb-3b995fb1637e>

INTRODUCTION

The Marine Geoscience for Marine Spatial Planning Program was established to address the seabed geoscience component of marine spatial planning initiatives in Canada. The West Coast of Canada is divided into four bioregions for marine spatial planning purposes: The Strait of Georgia, the BC South Coast, the BC North Coast and the Offshore (Figure 1). The BC North Coast region and part of the BC South Coast bioregion (the Salish Sea, comprising of the Strait of Georgia and Juan de Fuca Strait) are being addressed under the current program. Four main deliverables are being produced, of which a West Coast Digital Elevation model presented here is the first. The others are surficial geology, morphology, and grainsize/texture. In future, Seabed shear stress may be added as well under this program. This compilation addresses the need for a high resolution marine-based digital elevation model that encompasses the seabed bathymetry, coastal topography and available intertidal LIDAR from multiple government agencies.

Coverage includes the coast out to the continental slope and provides at least 5000 m horizontal distance inland from the coastline, integrating coastal topography and bathymetry. This coverage comprises the BC North Coast, BC South Coast, Vancouver Island, and Haida Gwaii. This publication presents the specifications, methods, data sources, and known issues to support the dataset. The extent covers the entire west coast of Canada's marine continental shelf including adjacent parts of Washington State in the Salish Sea.

The intent of this dataset is to provide a detailed and clean elevation surface for mapping at many scales from the entire Canadian west coast to large scale localities. It is meant to be used for scientific research including seafloor mapping, coastal hazards, and habitat identification. It can also be used as a basic mapping tool to assist in marine spatial planning in the coastal and marine environments. The dataset is not for navigational use. This product does not meet the requirements of the *Navigation Safety Regulations, 2020* under the *Canada Shipping Act, 2001*.

Official charts and publications, corrected and up-to-date, must be used to meet the requirements of those regulations.

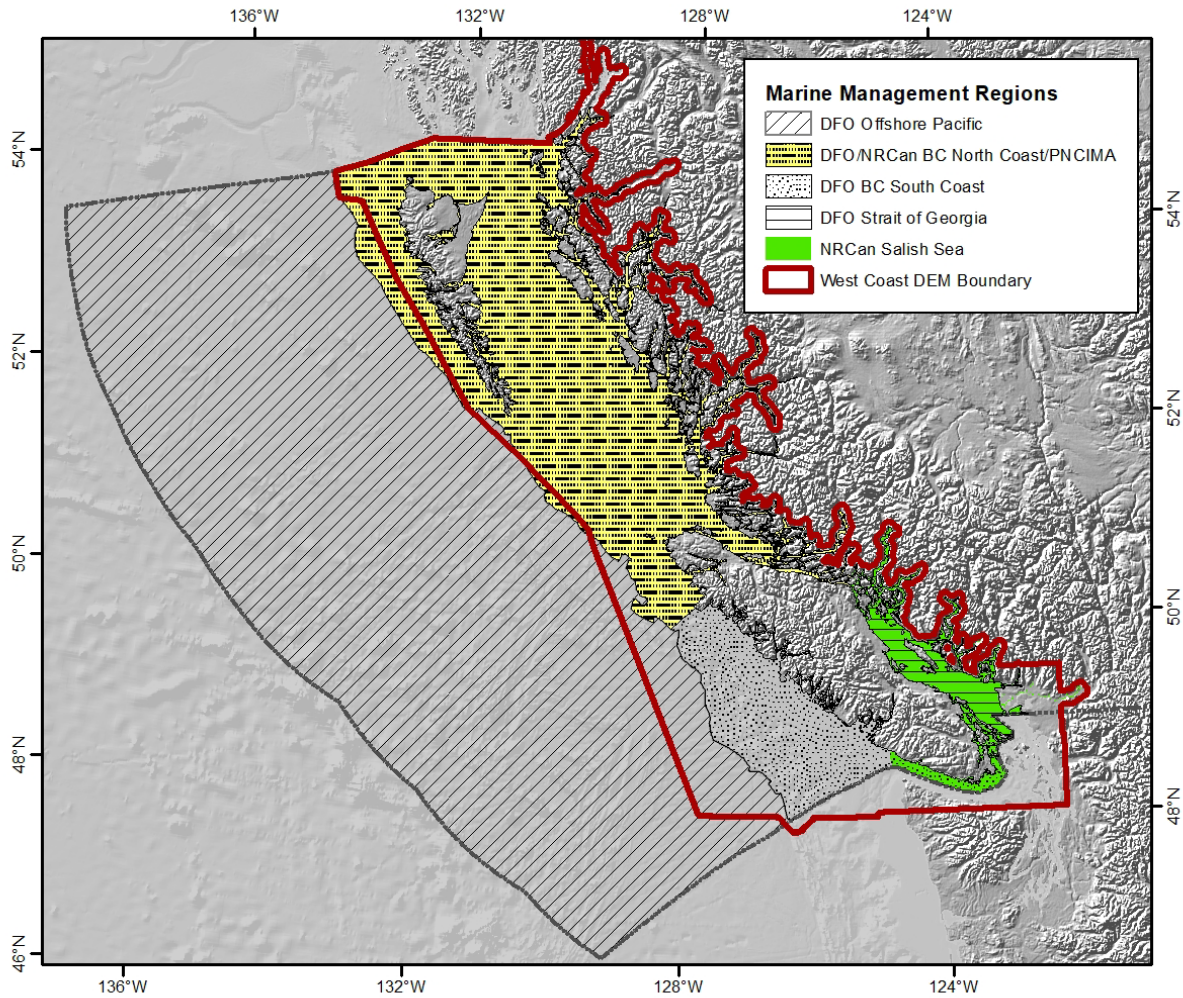

Figure 1. Map of Canadian Pacific Coastline with Marine Geoscience for Marine Spatial Planning (MGMSp) bioregions in current program highlighted in yellow (BC North Coast/PNCIMA) and green (Salish Sea). DFO bioregions are presented with polygon overlays. The footprint of the West Coast DEM is outlined in red. Base map by Ryan et al. (2009).

DEM SPECIFICATIONS

The West Coast DEM (Figure 2) was built to the specifications listed in Table 1. The inset in Figure 2 shows the extent boundary in red. The best available digital datasets were obtained by Natural Resources Canada and shifted to common horizontal and vertical datums: North American Datum 1983 BC Environment Albers and Chart Datum (lowest low water large tide (LLWLT) in tidal waters based on

local tide gauges (Canadian Hydrographic Service, 2022)). Data sources, methods, and assessment are described in the next sections.

Figure 2. Digital Elevation Model shown in colour on top of lower resolution Global Multi-resolution Topography (Ryan et al, 2009). Extent shown over map of Canada in red.

Table 1. Specifications for the West Coast, Canada DEM.

Grid Area	West Coast Canada to North American Continental Shelf
Coverage Area	120.95° to 134.81° W, 47.50° to 56.24° N
Coordinate System	Projected
Horizontal Datum	NAD83 BC Albers
Vertical Datum	CHS Chart Datum (LLWLT)
Vertical Units	Metres
Cell Size	10 m
Raster Format	ESRI File Geodatabase Raster Dataset, WMS and ArcServer web services

DATA SOURCES AND PROCESSING

Data Sources

Original data sourced for this model include multibeam echo sounder data, hydrographic field sheet soundings, hydrographic depth contours, airborne LiDAR data, and photogrammetry derived topography. The footprints of the input datasets are shown in Figure 3 and sources are described in Table 2.

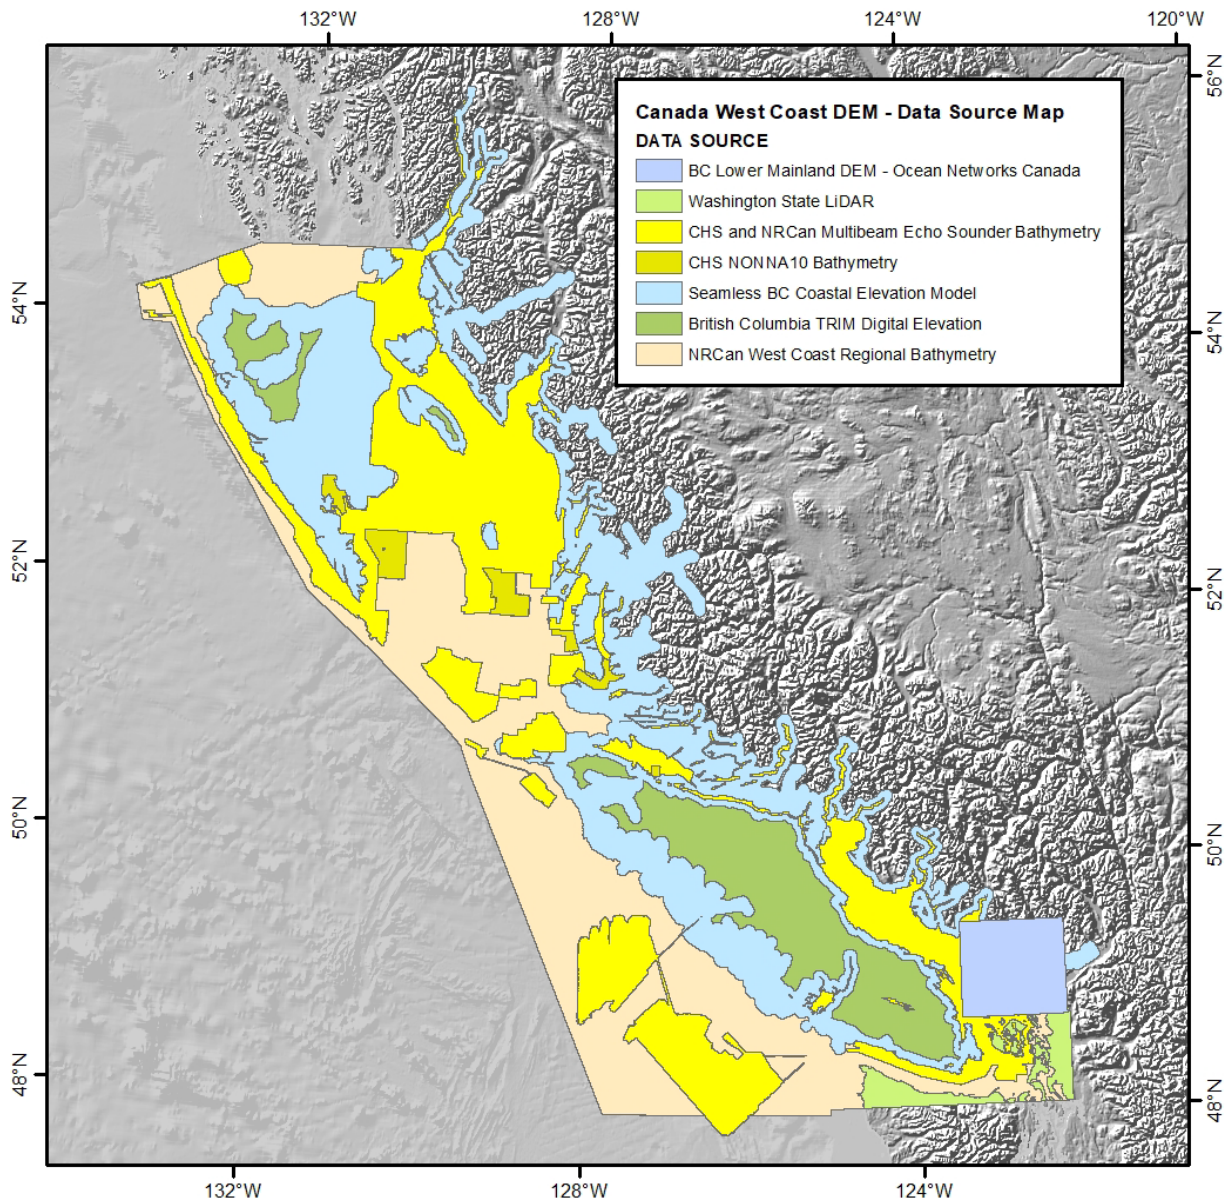

Figure 3. Polygons showing the input data source of the various areas of the digital elevation model. Basemap is from the Global Multi-resolution Topography (Ryan et al., 2009). More details on the data sources are available in Table 2.

Table 2. Bathymetric and Topographic Data Sources used in compiling the West Coast DEM.

Source/Title	Date	Data Type	Resolution	Horizontal Datum	Vertical Datum
CHS and NRCan/ Multibeam Echo Sounder Bathymetry	1994-2021	Gridded Bathymetry	1-5 m	EPSG 4326	Chart Datum (Lowest Low Tide (LLWLT))
Washington State/ LiDAR	2020	LiDAR	8 m	EPSG 2927/2926	NAVD88 vertical datum
DFO/ Seamless BC Coastal Elevation Model	2019	Gridded bathymetry and topography	20 m	EPSG 4326	Chart Datum (LLWLT)
Ocean Networks Canada/ BC Lower Mainland DEM	2019	Digital Elevation Model	3 m	EPSG 4326	CGVD 2013
CHS/ NONNA10 Bathymetry	2018	Gridded Bathymetry	10 m	EPSG 4326	Mostly Chart Datum (see linked metadata from source)
Government of British Columbia/ TRIM Digital Elevation	1999	Gridded Topography	25 m	EPSG 4269	Mean Sea Level
NRCan West Coast Regional Bathymetry	1999	Gridded bathymetry from chart contours	75 m	EPSG 4269	Chart Datum (LLWLT)

CHS and NRCan Multibeam Echo Sounder Bathymetry were collected between 1994 and 2021 at resolutions ranging from 1 to 5 metres. These data were acquired and processed by the Canadian Hydrographic Service under a memorandum of understanding with Natural Resources Canada (2021-0505-1260-NRCAN). A detailed list of surveys included is provided in Appendix A. The data were provided clean and corrected for sound velocity, tides, navigation and vessel offsets to International Hydrographic Organization (IHO) standards.

A coastal digital elevation model from Fisheries and Oceans Canada integrates ocean bathymetry and land topography described in Davies et al. (2019) at 20 m resolution. This compilation covers the data-sparse intertidal areas using field sheet data.

A regional digital elevation model from Natural Resources Canada developed from published CHS navigational chart contour data in 1999 is included at a resolution of 75 m. Contours were transformed to point depth data and then a triangulated irregular network was formed connecting these points to model the elevation. This compilation further transformed to a raster is used to fill in areas where high resolution data are not available.

A seamless digital elevation model of the British Columbia lower mainland, developed by Ocean Networks Canada during a workshop in Sept/Oct 2019 uses Greater Vancouver municipal LiDAR datasets, NRCan regional multibeam mosaics developed from CHS multibeam survey data, and airborne bathymetric LiDAR. This compilation provides high resolution continuous data for the lower mainland and southern Salish Sea. LiDAR data were downloaded and included from the Washington State Department of Natural Resources Lidar Portal at <https://lidarportal.dnr.wa.gov/#48.50159:-122.92946:10>. These data supplement the topography for the Washington State areas of the digital elevation model.

Shoreline

The Canadian Hydrographic Service (2007) provided a high-resolution coastline dataset at Higher High Water Large Tide (HHWLT) datum to determine the shoreline for this digital elevation model.

Methods

The datasets listed in table 2 were downloaded and compiled from their original data sources in their original formats and resolutions. All processing of the data was performed in ArcGIS 10.7 in a Windows Server 2012 Windows O/S / Oracle 11 Release 2 environment.

All data were projected into a common map projection, in this case a NAD83 BC Albers (EPSG 3005) with a central meridian of -126. As described by Klinkinberg (1995), this projection uses a central meridian located in British Columbia that is more central to this dataset than other national projections that tilt British Columbia as its westernmost province. The DEM data cross UTM Zones, but the area represented is close for NAD83 BC Albers, making this larger projection useful. Lastly, the projection provides uniform map display with little distortion for the British Columbia coast and province (Klinkinberg, 1995). This projection is also consistent with that used by the British Columbia Government.

All data were up sampled or down sampled to a common resolution of 10 meters, using appropriate resampling algorithms. Up sampling used a bilinear algorithm, and down sampling used a cubic convolution algorithm. Default settings were used in all algorithms. Origin of the point centre is the centroid of each cell.

Where necessary, data elevations were re-calculated to the vertical chart datum used by the Canadian Hydrographic Service. A continuous vertical datum model surface produced by CHS provides conversion to chart datum from CGVD2013 datum. As most source datasets were

already in chart datum, the decision was made to use chart datum as the vertical datum. The aim was to mitigate the introduction of additional errors in conversion by converting only the remaining datasets using the continuous vertical datum model. A future version may include transformation to CGVD2013 or another more commonly ellipsoidal-based datum. The terrestrial LiDAR from Washington State has not been converted from NAD88 at this time. As this dataset is primarily for use in marine applications and the footprint is comparatively small, this multi-step conversion process has not been prioritized. This may be done in a future iteration of the dataset.

Data were merged into a continuous elevation surface of 10 m. Priority was assigned by resolution with coarsest on the bottom and finest on the top. The compilation starts with NRCan regional scale data followed by TRIM topography, CHS NONNA bathymetry, DFO's seamless coastal elevation model for the transition from bathymetry to topography, then CHS multibeam mosaics, ONC's DEM, and finally LIDAR. The individual CHS bathymetry survey datasets were mosaicked into 5 m grids before integration. All datasets were merged as rasters rather than points for computational ease.

The output continuous elevation surface was hill-shaded using ArcGIS to create a shaded relief layer from a Northwest azimuth (315 degrees) at a 45 degree inclination with a vertical exaggeration of 2X to accentuate the relief. A source map was compiled from the vectorized polygons of the original data extents. Metadata were compiled using the NRCan Laboratoire de Cartographie Numérique et de Photogrammétrie (LCNP) online metadata editor ISO 19115:2003 NAP profile and are available with the dataset or by direct link:

<http://csw.open.canada.ca/geonetwork/srv/csw?service=CSW&version=2.0.2&request=GetRecordById&outputSchema=csw:IsoRecord&ElementSetName=full&id=e6e11b99-f0cc-44f7-f5eb-3b995fb1637e>

Quality control of the continuous elevation surface was done visually. Data were inspected for anomalies such as terracing, and irregular seams after merging of datasets.

DATA LIMITATIONS

The continuous elevation surface has an appropriate use scale of 1:50,000, and may be usable for some locations at 1:20,000 where data density allows. The data are intended to be used for scientific non-navigational or cartographic use at a bioregional or regional scale. The surface is not intended nor recommended for engineering or targeted scale projects. The data are not to be used for navigation.

As with all models, there are inaccuracies to be expected, in particular where source data are sparse. The NRCan 75 m regional bathymetric dataset is produced from chart contours with low data density and as such the vertical and horizontal uncertainty is high in the areas where this dataset is used. Bathymetry datasets, and in particular older datasets collected with less sophisticated sonars, are prone to artefacts such as those from NADIR lines and sound velocity

curves at edges of swaths. Intertidal data have been interpolated from field sheet data and use interpolation algorithms such as TIN and nearest neighbour. Low data density in these areas may cause small-scale bathymetric features to be missed. The highest uncertainty is expected in the intertidal areas where bathy LiDAR is not available and in the offshore.

Other than conversion of datums and resolution, datasets are used ‘as is’ from sources. As this new DEM merges multiple existing models, we acknowledge that any existing errors in original source material will be present in the new DEM.

FUTURE IMPROVEMENTS

This DEM is intended as an evergreen product that will be updated periodically as new data become available. At the time of publication, the map is hosted on the Federal Geospatial Platform (<https://open.canada.ca/data/en/dataset/e6e11b99-f0cc-44f7-f5eb-3b995fb1637e>) and future improvements are intended to remain hosted here. Future improvements will include adding new multibeam bathymetry collected since 2020, further LiDAR and bathy-LIDAR surveys for intertidal areas, and vertical LIDAR for steep slopes. The LiDAR for Washington State could be converted from NAVD88 to CGVD2018 using VDatum models and then converted to Chart Datum using the CHS grid to bring all datasets into a common vertical datum in the terrestrial regions. Alternatively, an ellipsoidal-based vertical datum may be used for all.

ACKNOWLEDGEMENTS

We thank those who produced the input datasets: Fisheries and Oceans Canada, Canadian Hydrographic Service, Ocean Networks Canada, and Washington State Department of Natural Resources. We thank the Canadian Hydrographic Service for their continued partnership and quality collection of bathymetric data. In particular, we thank Marlene Jeffries for her assistance with the continuous vertical datum model. This dataset is produced by Natural Resources Canada and incorporates Canadian Hydrographic Service data, pursuant to CHS MOU# 2021-0505-1260-NRCAN for illustrative, non-navigational purposes only. The incorporation of data sourced from CHS in this product shall not be construed as constituting an endorsement by CHS of this product. We thank Paul Fraser for reviewing this publication.
