DOMINION OBSERVATORIES

SEISMOLOGICAL BULLETIN - 1959

This report lists the instrumental results obtained at the seismological stations maintained by the Seismological Service of Canada. These are divided into two divisions.

Eastern Division

Ottawa, Ontario -

Dominion Observatory, Department of Mines and Technical Surveys.

Halifax, Nova Scotia -

Operated by Dalhousie University for the Dominion Observatory.

Seven Falls, Quebec -

Owned by the Quebec Power Company; operated by the Company for the Dominion Observatory.

Shawinigan Falls, Quebec -

Owned by the Shawinigan Water and Power Co.; operated by the Company for the Dominion Observatory.

Resolute, Northwest Territories -

Owned and operated by the Dominion Observatory.
R. Bourgoin in charge.

Local earthquakes are interpreted by means of travel-time curves based on rockburst studies. (See J. H. Hodgson, Publications of the Dominion Observatory, XVI, Nos. 5 and 6.)

DOMINION OBSERVATORIES

Western Division

Victoria, British Columbia -

Dominion Astrophysical Observatory, Department of Mines and Technical Surveys, Royal Oak, B.C.

Saskatoon, Saskatchewan -

Operated by the University of Saskatchewan for the Dominion Observatory.

Banff, Alberta -

Operated by the Banff School of Fine Arts for the Dominion Observatory.

Horseshoe Bay, British Columbia -

Owned and operated by the Dominion Observatory.

W. S. Blacklock in charge.

Alberni, British Columbia -

Owned and operated by the Dominion Observatory.

W. N. Burgess in charge.

Lillooet, British Columbia -

Owned and operated by the Dominion Observatory.

R. Roschard in charge.

Local earthquakes are interpreted by means of travel-time curves based on blast studies. (See W. G. Milne and W. R. H. White, Publications of the Dominion Observatories, XXIV, No. 7.) Records for all stations of the Seismological Service of Canada are stored on microfilm in Ottawa. Positive microfilm copies, or full-scale prints, will be sent on request. Beginning in 1960 records of the station at Brebeuf College, Montreal, are included in the microfilm file through the courtesy of M. Buist, S.J., Director.

Magnification curves for the various instruments operated at the above stations will be found on the following pages.

John H. Hodgson,
Chief, Division of Seismology.

SEISMOLOGICAL BULLETIN - 1959

Explanation of Calibration Curves

Calibration curves for all the seismographs of the Canadian network have now been determined using a bridge circuit developed by this Observatory (see P.L. Willmore, "The Application of the Maxwell Impedance Bridge to the Calibration of Electromagnetic Seismographs", Bull. Seis. Soc. Am., in press). Estimated curves are included for the instruments which have not yet been calibrated, and are distinguished from the others by the absence of calibration points. The curves show the velocity sensitivity of each instrument (i.e. the trace displacement in centimetres for unit particle velocity in the ground) as a function of the period of the earthquake waves.

For waves of period T , the magnification and the acceleration sensitivity of any instrument can be determined by multiplying the velocity sensitivity by $\frac{2\pi}{T}$ or by $\frac{T}{2\pi}$ respectively. To facilitate these conversions, lines of constant magnification and of constant acceleration sensitivity are ruled across each graph, the former sloping upwards from left to right, and the latter from right to left. To find the magnification of an instrument for ground waves of any given period, place one point of a pair of dividers on the calibration curve at the appropriate period, and adjust the other point to rest vertically below the first on a magnification line. Move the dividers so that the lower point falls on a horizontal grid line marked with an exact power of 10. The upper point of the dividers will then indicate the magnification. The decimal multiplier will be determined by the fact that the magnification must lie between the values indicated on the datum lines above and below the calibration point. The acceleration sensitivity can be found in the same way as the magnification; starting with an acceleration datum line.

NOTES

JANUARY - MARCH - 1959

1. Ottawa The short period Vertical Benioff seismograph was
Ontario recalibrated on March 25, 1959 and calibration curves will
 be found on page 10.
2. Canadian earthquakes may be found on pages 68 to 72.
3. I.G.Y. Microseismic Bulletin may be found on pages 73 to 88.
4. Calibration curves for all existing Canadian Seismograph Stations may be
 found on pages 5 to 16.

NOTES

Four stations only have been read,

An Atlantic station - Halifax,
An inland station - Ottawa,
An Arctic station - Resolute, and
A Pacific station - Victoria.

The following instruments are used:

| | | | |
|---------------------|---|--------------------------|----------------------------|
| Halifax - Willmore | Z | T _s = 1 sec. | T _g = 2.0 sec.* |
| Ottawa - Benioff | Z | T _s = 1 sec. | T _g = 75 sec. |
| Resolute - Columbia | Z | T _s = 10 sec. | T _g = 23 sec. |
| Victoria - Benioff | Z | T _s = 1 sec. | T _g = 75 sec. |

* As of February 1, 1959 the readings from the Halifax station were discontinued, and readings from the remaining stations will be read only, at six hour intervals.
