FOREWORD

This publication series, "Seismological Series of the Earth Physics Branch", is a continuation of the series entitled "Seismological Series of the Dominion Observatory" with the same purpose. It provides an inexpensive medium for the publication and distribution at irregular intervals of seismological material and results of particular Canadian interest. The series developed from the new form of Seismological Bulletin first published for the year 1954. In 1960, an issue code was adopted after which the first issue in any year was designated -1, the second -2, and so on. Because of historical precedent, the first issue in any year was reserved for the seismological bulletin.

Because of changing procedures in the bulletin preparation, the increasing use of the series for the publication of summary information on Canadian seismicity and material relevant to the Canadian Standard Seismic Network, serial numbering of the series is now preferred. On April 1, 1970, the astronomical functions of the Observatories Branch were transferred to the National Research Council of Canada, and the geophysical functions reorganized within an Earth Physics Branch of the Department of Energy, Mines and Resources.

Accordingly, with the new title for the publication, serial numbering is adopted commencing with No. 59. A list follows of the number published in the series to date. A small number of reprints of earlier issues is available on request to the Division of Seismology: an asterisk indicates that the reprint supply is exhausted.

K. Whitham

Canadian Standard Seismic Network, December 1970

SEISMOLOGICAL BULLETIN

JANUARY - DECEMBER, 1970

This report lists the P phase recordings obtained at the seismological stations maintained by the Seismological Service of Canada. All earthquakes reported by station operators are included except for local earthquakes with an estimated magnitude less than 3. The association of the station readings with earthquakes determined by the National Oceanic and Atmospheric Administration (NOAA) is not listed, and epicentral and instrumental data on local earthquakes not included. However, a separate bulletin containing full information on Canadian earthquakes during 1970 will be issued as soon as possible.

Unless otherwise stated, the stations listed are first order (3 short period and 3 long period seismographs) producing photographic records. A second-order station usually consists of one short period vertical "visual" seismograph (a stylus records the signal on heat-sensitive paper). The second-order station at Sept-Iles produces a photographic record.

Alberni, British Columbia - station code, ALB (2nd order)

Instrumented by the Earth Physics Branch. Operated for the Earth Physics Branch by W.N. Burgess.

Alert, N.W.T. - station code, ALE

Owned and operated by the Earth Physics Branch. Station seismologist in 1970 was W. T. Piché.

Baker Lake, N.W.T. - station code, BLC

Owned and operated by the Earth Physics Branch. Station seismologist in 1970 was O. J. Jensen.

Edmonton, Alberta - station code, EDM

Owned by the University of Alberta. Operated under contract for the Earth Physics Branch by the University of Alberta.

Flin Flon, Manitoba - station code, FFC

Owned by the Earth Physics Branch. Operated by the Canadian Armed Forces, Department of National Defence.

Fort Churchill, Manitoba - station code, FCC

Owned by the Earth Physics Branch. Operated under contract for the Earth Physics Branch by the Radiosonde Division, Meteorological Branch, Ministry of Transport.

Fort St. James, British Columbia - station code, FSJ

Owned and operated by the Earth Physics Branch. Station seismologist during 1970 was T.S. Browne.

Frobisher, N.W.T. - station code, FBC

Owned by the Earth Physics Branch. Operated under contract for the Earth Physics Branch by the Radiosonde Division, Meteorological Branch, Ministry of Transport.

Great Whale River, Poste de la Baleine, Quebec - station code, GWC

Owned and operated by the Earth Physics Branch. Station seismologist in 1970 was W.E. Shannon, succeeded by P.A. Fournier.

Halifax, Nova Scotia - station code, HAL

Owned by the Earth Physics Branch. Operated under contract for the Earth Physics Branch by Dalhousie University.

Inuvik, N.W.T. - station code, INK

Owned by the Earth Physics Branch. Operated under contract for the Earth Physics Branch by the Radiosonde Division, Meteorological Branch, Ministry of Transport.

Mica Creek, British Columbia - station code, MCC (2nd order)

Vault owned and operated by B.C. Power and Hydro Authority, but instrumented by the Earth Physics Branch.

Montreal, Quebec - station code, MNT

Owned and operated by Jean-de-Brebeuf College with contract support from the Earth Physics Branch. (Courtesy M. Buist, S.J., Director.)

Mould Bay, N.W.T. - station code, MBC

Owned and operated by the Earth Physics Branch. Station seismologist during 1970 was R.B. Horner, succeeded by G.D.A. Weston.

Ottawa, Ontario - station code, OTT

Owned and operated by the Earth Physics Branch.

Penticton, British Columbia - station code, PNT

Owned and operated by the Earth Physics Branch. Station seismologist during 1970 was M. Wilde.

Port Hardy, British Columbia - station code, PHC

Owned by the Earth Physics Branch. Operated under contract for the Earth Physics Branch by the Radiosonde Division, Meteorological Branch, Ministry of Transport.

Resolute, N.W.T. - station code, RES

Owned and operated by the Earth Physics Branch. Station seismologist until March 26 was R.E. Simmons, replaced by A.E. Taylor, who was succeeded by V.E. Cummins in early July.

Saint John's, Newfoundland - station code, STJ

Owned by the Earth Physics Branch. Operated under contract for the Earth Physics Branch by Memorial University.

Scarborough, Ontario - station code, SCB

Owned by the Earth Physics Branch. Operated under contract for the Earth Physics Branch by the Radiosonde Division, Meteorological Branch, Ministry of Transport.

Schefferville, Quebec - station code, SCH

Owned by the Earth Physics Branch. Operated under contract for the Earth Physics Branch by McGill University Sub-Arctic Research Laboratory.

Sept-Iles, Quebec - station code, SIC (2nd order)

Owned and operated by the North Shore and Labrador Railway Company, Sept-Iles, Quebec, with contract support from the Earth Physics Branch.

Seven Falls, Quebec - station code, SFA

Owned and operated by the Earth Physics Branch. Station seismologist during 1970 was J. B. Racine.

Sudbury, Ontario - station code, SUD (2nd order)

Instrumented by the Earth Physics Branch. Operated under contract for the Earth Physics Branch by Laurentian University.

Suffield, Alberta - station code, SES

Owned by the Earth Physics Branch. Operated for the Earth Physics Branch by Defence Research Board, Department of National Defence.

Thunder Bay, Ontario - station code, LHC

Owned by the Earth Physics Branch. Operated under contract for the Earth Physics Branch by Lakehead University.

Victoria, British Columbia - station code, VIC

Owned and operated by the Earth Physics Branch. The seismic observatory is part of the Victoria Geophysical Observatory, Department of Energy, Mines and Resources, 5071 W. Saanich Rd., R.R. 7, Victoria, B.C. This unit constitutes the West Coast office of the Earth Physics Branch.

Yellowknife, N.W.T. - station code, YKC

Owned and operated by the Earth Physics Branch. Station seismologists during 1970 were M. M. Kuntz (O.I.C.), C. Huibers and L. G. Dussault.

No new stations were commissioned during 1970, and no older stations de-commissioned. A map of the stations of the Canadian Standard Seismic Station Network as of December 1970 follows. Against each station the year of original commissioning is shown. Earlier issues of the Bulletin must be consulted to trace the evolution of the network and its instrumentation throughout the years.

Records for all stations of the Seismological Service are stored on 35 mm microfilm in Ottawa. Positive microfilm copies of records prior to July 1, 1966, are available to co-operating institutions on request to the Chief of the Division of Seismology, Earth Physics Branch, 3 Observatory Crescent, Ottawa, Ontario, Canada, K1A 0E4. From July 1, 1966, till December 31, 1967, all records from the Canadian Standard Seismograph Network were sent to the Seismological Data Centre, National Weather Records Centre, Federal Building, Asheville, North Carolina, 28801, U.S.A., for microfilming with the American WWSSN (World-Wide Seismic Station Network) records. This service was discontinued December 31, 1967, and microfilming since then has been done in Ottawa with copies of all 35 mm negative microfilm sent to Asheville. Requests for microfilm or full-scale prints of Canadian seismograms may therefore still be obtained from the Asheville Centre, from which a schedule of charges is available. This procedure will continue to make copies of Canadian seismograms more readily available than has been possible in the past.

Magnification curves for all the various seismographs operated at the stations are found on the following pages. The curves are obtained by application of the Willmore bridge method on site. Earlier bulletins have given an explanation of these curves: the magnification and acceleration sensitivity of any instrument is simply determined by multiplying the velocity sensitivity by $2\pi/T$ or $T/2\pi$, respectively. The magnification curves show the periods of the seismometers and the galvanometers, and summary information on the co-ordinates, altitude, foundation material and date of calibration is included.

The phase response as a function of period of the various seismographs has been calculated in Ottawa, whenever useful, by using a digital computer. Such information is available on request.

Following the calibration curves, computer listings are given of the P phases recorded at the stations of the Network. This information is identical to that supplied from all first-order stations to the United States National Oceanic and Atmospheric Administration for preliminary epicentral determinations, and from all stations, with a time lag of several months, to the International Seismological Centre and elsewhere for the definitive epicentral catalogues. The station three-letter code is followed by the day of the month, the P onset in hours, minutes and seconds (tenths of seconds if the direction of first motion is definite) and either emergent (EP) or impulsive (IP) phase character. Whenever possible, the direction of first motion of the short period vertical seismograph is indicated by either "C" for compression or "D" for dilatation. Period of P in seconds (T) and ground amplitude in millimicrons (Ag) are given by nearly all first-order stations for those earthquake P arrivals that have, within the first five seconds of the P arrival, a peak-to-peak trace amplitude of four or more millimetres. In some cases these measurements cannot be made due to non-uniform wave cycles and also due to faint traces. The listing from the station data supplied on punched cards or digital tape to international organizations has been machine-sorted into chronological order for each month of the year.

Mr. R. J. Halliday continued as seismologist in charge of quality control of the seismic network, assisted by Mr. A. Houle until August and by Mr. W. E. Shannon from October. Mr. F. Lombardo continued as the senior technical officer for station maintenance, calibration and installation. Dr. F. Kollar was in charge of the central seismological laboratory in Ottawa supporting and servicing the network.

1970 BULLETIN NOTES

During the interval, September to December, period and polarity checks were made at 15 of the 24 network stations. The results of these tests showed the long period seismometers did not vary by more than 3 per cent (3%), except for one instrument which had a period 15 per cent longer than normal, another longer by 7 per cent and another by 5 per cent. The period checks of the Willmore short period seismometers showed no variations above 2 per cent with the exception of one instrument which showed a 4 per cent change in period.

ALBERNI

On March 22, 1967, a second-order seismograph was put into operation, consisting of a short period vertical seismometer with a UED 211A amplifier and a heli-corder system.

For the year 1970, the polarity of the short period seismograph was reversed. All data found in this publication has been corrected and polarity reversal noted on each seismogram. The polarity reversal was from November 7, 1969, until March 12, 1971.

EDMONTON

During the month of May, "as found" calibrations were performed on the existing three-component short period seismographs and the three-component long period seismographs. At this time the two short period horizontal Willmore Mark I seismometers were replaced with newer Mark II models. The short period seismographs were reset and calibrated. The existing three long period Press Ewing seismometers were replaced with new standard long period Columbia-type seismometers and GL 261-type long period galvanometers. All long period seismometers were set to 15 seconds (15") and calibrated. Calibration curves for the "as found" conditions and the final new settings will be found in the following pages of this bulletin. In addition, a new time control system and standby power system were incorporated at that time.

FORT ST. JAMES

During the last week of October 1970, "as found" calibrations were performed on the six standard instruments, consisting of three short period and three long period seismographs. The long period seismographs were found to be in suitable operating condition and hence were left operating in the "as found" condition. The responses of the short period Willmore seismographs were changed and new calibrations were performed. All nine calibrations will be found in the following pages of this bulletin.

HALIFAX

The galvanometer for the long period north-south seismograph was broken on June 5 and replaced June 8. With the aid of a galvanometer calibration performed at the station, a theoretical calibration for the seismograph was performed in Ottawa. The variation between the calibrations using the old and new galvanometers was found to be less than 5 per cent. The curves calculated in Ottawa for this instrument will be included in this bulletin.

MICA CREEK

On July 3, 1966, a second-order seismograph station was commissioned. The instrumentation consists of a short period vertical seismometer with a UED EA 211A amplifier and a heli-corder system.

From November 25, 1969, the gain was lowered on the amplifier from -18db to -24db. In addition, the seismometer was highly underdamped, as can be seen by the shape of the corresponding magnification curve of the system.

On February 12, 1970, the seismometer damping was corrected and curves illustrating these two conditions will be found in this bulletin. From November 11, 1969, until September 3, 1970, the polarity of the seismograph was reversed. All data found in this publication have been corrected and any polarity reversal noted on each seismogram.

MONTREAL

During the year, the short period vertical Benioff seismograph operated with an underdamped seismometer. This condition was confirmed on February 6, 1971, at which time the system was corrected to comply with the normal calibration as published in the previous bulletin. The calibration curves shown in this bulletin correspond to the undamped operation of the short period vertical seismograph during 1970.

MOULD BAY

On February 17, 1970, the galvanometer suspension tube for the long period horizontal north-south seismograph was replaced due to its erratic behaviour. A calibration of the galvanometer was performed (photographically) at the station and the results utilized to calculate a new calibration curve for the seismograph. The results of this calibration show the new curve as being similar to the old except from the 60 second period to 200 second period range which is about 10 per cent lower in magnification. A copy of this calibration, along with the previous calibration, will be found in this bulletin.

OTTAWA

On April 6, 1970, the source of time for the seismographs was changed. The Dominion Observatory time system, which was linked directly to the seismograph station, was discontinued and a crystal-controlled chronometer was incorporated into the station at this time. A standby power system is also available in the event of any power failure.

On November 18, 1970, the Ottawa long period north-south galvanometer was replaced due to its erratic behaviour. A bridge calibration was performed on the seismograph and a new curve is published in this bulletin along with the previous calibration.

PENTICTON

In late May 1970, the station instruments were calibrated under the "as found" conditions. The short period vertical Willmore seismometer was reset and a repeat calibration was performed. The three-component long period Columbia-type seismometers had their periods reset to 15 seconds and a new bridge calibration was performed. Calibration curves for all the conditions listed above are to be found in this publication.

On July 9, a new attenuator was installed in the circuit for the short period seismographs. As a result, the polarities were reversed until September 25, 1970, at which time this situation was corrected. The short period vertical calibration from March 1965 to May 1970 was a factor of two low. Curves showing this discrepancy are included in this bulletin.

PORT HARDY

Until April 4, 1970, the values for the magnification as printed on the three long period seismograms were in error. The correct values should have been 1900, 2100 and 1900 for the vertical, north and east respectively.

In October 1970, the six station seismographs were calibrated in the "as found" condition. The three long period seismometer periods were lowered to 15 seconds and the seismographs were recalibrated. Calibration curves for the six instruments will be found in this bulletin.

ST. JOHN'S

On February 1, 1968, the instrument gains were all lowered to one-half the 1967 calibrated value. Curves showing these new values will be included in this bulletin.

SEVEN FALLS

From March 15 to April 5, the station was closed down so that the building could be rewired to modern standards.

SUFFIELD

Starting on May 22, 1970, all six seismographs were calibrated "as found". The long period seismograph calibrations showed slight changes and so no changes were necessary at this time. The short period seismographs were altered and recalibrated. The reason for the short period change was to increase the seismograph sensitivity in the teleseism range. All nine calibrations will be found in this publication.

VICTORIA

During the first week of November, "as found" calibrations were performed on the six station seismographs consisting of three-component short period Benioffs and three-component long period Columbias.

Calibration curves are included in this publication.

STATION: ALBERNI
