SEISMOLOGICAL BULLETIN

JANUARY - DECEMBER 1968

This report lists the P-phase recordings obtained at the seismological stations maintained by the Seismological Service of Canada. All earthquakes reported by station operators are included except for local earthquakes with an estimated magnitude less than 3. The association of many of the station readings with USCGS-determined earthquakes is no longer listed, and epicentral and instrumental data on local earthquakes no longer included. However, a separate bulletin containing full information on Canadian earthquakes during 1968 will be issued as soon as possible. The seismological stations are divided into two regions.

EASTERN DIVISION

Alert, N.W. T. - station code, ALE

Owned and operated by the Dominion Observatory. Station seismologist B. Leahy was replaced March 26 by N. Drexell, who was succeeded in July by H. von Hacht.

Baker Lake, N.W. T. - station code, BLC

Owned and operated by the Dominion Observatory. Station seismologist in 1968 was O. J. Jensen.

Churchill, Manitoba - station code, FCC

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the Radiosonde Division, Meteorological Branch, Department of Transport.

Coppermine, N.W. T. - station code, CMC

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the Radiosonde Division, Meteorological Branch, Department of Transport.

Edmonton, Alberta - station code, EDM

Owned by the University of Alberta. Operated under contract for the Dominion Observatory by the University of Alberta.

Flin Flon, Manitoba - station code, FFC

Owned by the Dominion Observatory. Operated by the Canadian Armed Forces, Department of National Defence.

Frobisher, N.W. T. - station code, FBC

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the Radiosonde Division, Meteorological Branch, Department of Transport.

EASTERN DIVISION (cont.)

Great Whale River, Poste de la Baleine, Quebec - station code, GWC

Owned and operated by the Dominion Observatory. Station seismologist in 1968 was D. E. Stoltz, succeeded by G. B. Nordman.

Halifax, Nova Scotia - station code, HAL

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by Dalhousie University.

Inuvik, N.W.T. - station code, INK

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the Radiosonde Division, Meteorological Branch, Department of Transport.

Montreal, Quebec - station code, MNT

Owned and operated by Jean-de-Brêbeuf College with contract support from the Dominion Observatory (courtesy M. Buist, S.J., Director).

Mould Bay, N.W.T. - station code, MBC

Owned and operated by the Dominion Observatory. Station seismologist during 1968 was B. P. Chernoff, succeeded by W. T. Piché.

Ottawa, Ontario - station code, OTT

Owned and operated by the Dominion Observatory.

Resolute, N.W.T. - station code, RES

Owned and operated by the Dominion Observatory. Station seismologist during 1968 was G. R. Green, succeeded by A. G. Blair.

Saint John's, Newfoundland - station code, STJ

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by Memorial University.

Scarborough, Ontario - station code, SCB

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the Radiosonde Division, Meteorological Branch, Department of Transport.

Schefferville, Quebec - station code, SCH

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by McGill University Sub-Arctic Research Laboratory.

Sept-Iles, Quebec - station code, SIC

Owned and operated by the North Shore and Labrador Railway Company, Sept-Iles, P. Q., with contract support from the Dominion Observatory.

EASTERN DIVISION (cont.)

Seven Falls, Quebec - station code, SFA

Owned and operated by the Dominion Observatory. Station seismologist during 1968 was J. B. Racine.

Sudbury, Ontario - station code, SUD

Instrumented by the Dominion Observatory. Operated under contract for the Dominion Observatory by Laurentian University.

Yellowknife, N.W. T. - station code, YKC

Owned and operated by the Dominion Observatory. Station seismologists during 1968 were M. M. Kuntz (O.I.C.), W.R. Challice and M. Hibbert-Hyde; the latter two were succeeded by C. Huibers and L. G. Dussault.

WESTERN DIVISION

Alberni, British Columbia - station code, ALB

Instrumented by the Dominion Observatory. Operated under contract for the Dominion Observatory by W. N. Burgess.

Fort St. James, British Columbia - station code, FSJ

Owned and operated by the Dominion Observatory. Station seismologist during 1968 was T. S. Browne.

Mica Creek, British Columbia - station code, MCC

Vault owned and operated by B.C. Power & Hydro Authority, but instrumented by the Dominion Observatory.

Penticton, British Columbia - station code, PNT

Owned and operated by the Dominion Observatory. Station seismologist during 1968 was M. Wilde.

Port Hardy, British Columbia - station code, PHC

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the Radiosonde Division, Meteorological Branch, Department of Transport.

Suffield, Alberta - station code, SES

Owned by the Dominion Observatory. Operated for the Dominion Observatory by Defence Research Board, Department of National Defence.

Victoria, British Columbia - station code, VIC

Owned and operated by the Dominion Observatory. The operating centre of the western division is the Dominion Astrophysical Observatory, Department of Energy, Mines and Resources, R.R. #7, Victoria, B.C.

A first-order standard station was commissioned during 1968 at Inuvik on September 25. Because of staff shortage, the Department of Transport did not commence daily seismic operations until late February 1969.

Records for all stations of the Seismological Service are stored on 35 mm microfilm in Ottawa. Positive microfilm copies of records prior to July 1, 1966, are available to cooperating institutions on request to the Chief of the Division of Seismology, Dominion Observatory, 3 Observatory Crescent, Ottawa 3, Ontario, Canada. From July 1, 1966, until December 31, 1967, all records from the Canadian Standard Seismograph Network were sent to the Seismological Data Centre, National Weather Records Centre, Federal Building, Asheville, North Carolina, 28801, U.S.A., for microfilming with the American WWSSN (World Wide Seismic Station Network) records. This service was discontinued December 31, 1967, and microfilming for 1968 was done in Ottawa with copies of all 35 mm negative microfilm sent to Asheville. Requests for microfilm or full-scale prints of Canadian seismograms may therefore still be obtained from the Asheville centre, from which a schedule of charges is available. This new procedure will continue to make copies of Canadian seismograms more readily available than has been possible in the past.

Magnification curves for all the various seismographs operated at the stations are found on the following pages. The curves are obtained by application of the Willmore bridge method on site. Earlier bulletins have given an explanation of these curves: the magnification and acceleration sensitivity of any instrument is simply determined by multiplying the velocity sensitivity by $2\pi/T$ or $T/2\pi$, respectively. The magnification curves show the periods of the seismometers and the galvanometers, and summary information on the coordinates, altitude, foundation material and date of calibration is included.

The phase response as a function of period of the various seismographs has been calculated in Ottawa, whenever useful, by using a digital computer. Such information is available on request. When the Canadian Standard Seismic Network is nearer completion, and some instrumental settings no longer experimental, a bulletin will be issued containing the phase response calibration curves.

Following the calibration curves, computer listings are given of the P phases recorded at the stations of the Network. This information is identical to that supplied immediately from certain selected stations to the United States Coast and Geodetic Survey for preliminary epicentral determinations, and from all stations with a time lag of several months to the International Seismological Centre and elsewhere for the definitive epicentral catalogues. The station three-letter code is followed by the day of the month, the P onset in hours, minutes and seconds (tenths of seconds if the direction of first motion is definite) and either emergent (EP) or impulsive (IP) phase character. Wherever possible, the direction of first motion of the short period vertical seismograph is indicated by either a C for compression or a D for dilatation. Period of P in seconds (T) and ground amplitude in millimicrons (A_g) are given by several selected stations for those earthquake P arrivals that have, within the first five seconds of the P arrival, a peak-to-peak trace amplitude of four or more millimetres. In some cases these measurements cannot be made because of nonuniform wave cycles

and also because of faint traces. The listing from the station data supplied on punched cards to international organizations has been machine-sorted into chronological order for each month of the year.

Mr. R. J. Halliday continued as engineer-in-charge of quality control of the seismic network and Mr. F. Lombardo as the senior technical officer for station maintenance, calibration and installation. Dr. F. Kollar was in charge of the central seismological laboratory in Ottawa supporting and servicing the network.

Kenneth Whitham
Chief, Division of Seismology

1968 BULLETIN NOTESALERT

The station was closed down from March 7 to 25 during a change of operators; hence, no records are available for this time interval. From April 18 to 25 "as found" calibrations were performed on the six station seismographs. At this time, the two short-period horizontal Willmore Mark I seismometers were replaced with the Mark II model. The three-component short-period system was calibrated with three seismometers set to one-second period. The three long-period seismometers were reset to 15 seconds and calibrations repeated. In addition, the associated electronics were replaced with more up-to-date equipment. Calibration curves will be found on other pages in this bulletin.

COPPERMINE

A malfunction in the console electronic equipment forced the Vela Uniform portion of the station to close down from February 29 to December 7. The standard stations long-period north-south seismometer was erratic in its performance from January to October because of a bent suspension wire. The seismograms from March 1 to 14 have no time marks because of a faulty timing system.

FROBISHER

The station was closed from May 17 to 21 so that "as found" calibrations could be performed on all six seismographs. During the calibration, it was discovered that the long-period vertical seismometer had been mistakenly set to 15 seconds rather than the normal 30-second period. The three long-period seismometers were reset to 15 seconds and the calibrations repeated. From May 19 to June 27, the gain on the long-period north-south seismograph was operating at twice its normal value. The constants as shown on the seismograms, are correct. On June 28, the short period vertical galvanometer was broken and replaced. The calibration curve, as shown in the bulletin, is correct as corrections were made to the attenuator to compensate for the difference in the two galvanometers. From the time the galvanometer was installed, the polarity was reversed until August 23. All seismograms were changed to correct this error before being microfilmed.

HALIFAX

The large microseism background level made it necessary to lower the gain to half its value on the long-period seismographs from April 1 to October 15. The published curves in the bulletin are shown for full gain.

INUVIK

During a two-week interval in September, a six-component standard station was installed. The short-period seismographs with seismometer periods of one second and long-period seismographs with seismometer settings of 15 seconds were calibrated at this time. Although the station electronic equipment was operational through the winter months, no seismograms were produced until late February 1969 because of a shortage of staff.

MOULD BAY

From April 30 to May 5 the station was out of operation. At this time "as found" calibrations were performed on all six seismographs. Model Mark II Willmore seismometers set at one second were installed with new 1/4-second galvanometers and attenuators. All three instruments were recalibrated. The long-period seismographs were overhauled and calibrated with the seismometers operating at a period of 15 seconds. Calibration curves will be found in the bulletin.

PENTICTON

Because of an intermittent fault in the long-period north-south attenuator, the response was frequently higher than the calibration curve indicated. A new attenuator installed on March 17, 1969, corrected this defect.

RESOLUTE

Between April 28 and May 14, the station was closed down for alterations and calibrations. "As found" calibrations were performed, and the six existing seismographs were replaced with later model instruments. Three Willmore Mark II short-period seismometers, operating at one-second period, were installed, along with new attenuators and 1/4-second galvanometers. Three Sprengnether-type long-period seismometers, operating at 15 seconds, with three Geotech model GL 261 galvanometers and attenuators were also installed. New calibrations, as well as the "as found" calibrations were performed on all six instruments with curves published in this bulletin.

ST. JOHN'S

As of February 7, the instruments are operating at 1/2 gain, because of the large microseism background level. The magnification curves as published are for full gain only.

SCARBOROUGH

During the period January 14 to 20, a new long-period vertical galvanometer was installed. The long-period seismometers were reset to 15-second period and all six seismographs (including the S. P. Willmores) were calibrated at this time. Since this station is primarily used as a training centre, no operators are available between training programs. As a result, no records are available for the following time intervals: April 30 to May 21; August 1 to September 4; and October 24 to December 31.

SEPT-ILES

Power failures, lack of operators and hazardous travel conditions, prevented records from February 2 to March 12, October 1 to 10, and November 1 to 16.

SCHEFFERVILLE

From December 7 to December 12, the station was closed down. New coils were installed in the two short-period horizontal Willmore seismometers, which enabled us to further damp the instrument to conform with other standard network instrumentations. New associated electronics, such as chronometer, radio, standby power systems were installed. New calibrations were performed on all six seismographs with the seismometers set to the standard settings of one second for the short-period and fifteen seconds for the long-period seismometers.

VICTORIA

On April 9 the gain on the short-period vertical and short-period north-south Benioff seismographs was increased by a factor of 2 to the level of the short-period east.

YELLOWKNIFE

The long-period vertical galvanometer was erratic in its behaviour and so was replaced on April 18. The calibration curve until November 28 is a theoretical one obtained from calibration of the new galvanometer in Ottawa. On November 28, the period of the long-period vertical seismometer was reset to 25 seconds and a new theoretical curve is shown.

Special Note:

For the Box-car event, most stations were operating at a much reduced gain setting. This information can be found written on each original seismogram. Calibration curves for these changes may be obtained through the Ottawa office.
