### Abstract

Temperature data from 7147 wells in Saskatchewan and 631 wells in Manitoba have been compiled. Preliminary analysis of temperature gradients show numerous small anomalies.

### Resumé

On a compilé les données de température de 7147 puits en Saskatchewan et de 631 puits au Manitoba. L'analyse préliminaire des gradients de température montre de nombreuses petites anomalies.

## 1. INTRODUCTION

During tenure of this contract temperature data from petroleum exploration well logs from Saskatchewan and Manitoba have been accessed and some initial analysis of the data undertaken.

The data were obtained from the well log files maintained by the Department of Mineral Resources, Province of Saskatchewan. The temperature data were those bottom-hole temperature measurements made during service company logging runs and recorded on the log headers.

The intent was to obtain temperature values for up to 12 wells per township/range area. If less than 12 wells exist in a township/range area, all the data from that area were taken. If more than 12 wells exist in a township/range area, then data from at least 12 wells have been recorded, and more than twelve when the remaining data for that area appeared to be of reasonable quality.

For some wells, more than one logging run was made and temperature records for the runs were recorded. In such cases all the temperature data were recorded as well as any time information.

There have been no corrections made on the data presented.

Complete listings of the data are given in the appendices.

## 2. SASKATCHEWAN

Temperature data from 7,147 wells in Saskatchewan have been obtained. This has given 7,764 temperature values.

Figure 1 shows the locations of wells from which bottom hole temperature values have been taken from the logs superimposed on a map of Saskatchewan.

For preliminary analysis the province of Saskatchewan was separated into three areas:

- (1) TWP 1-40W1
- (2) TWP 1-80W2
- (3) TWP 1-90W3

### (a) Area 1: TWP1-40W1

Figure 2 shows the well locations for area (1) as above. Figure 3 gives the well locations for this area on a township/range grid. It should be noted that the township/range system in Saskatchewan consists of three separate systems as well as some individual oddities, so the township/range grids as in the accompanying figures are only approximate.

Figure 4 is a temperature/depth plot for all the data in the area TWP1-40W1. It shows a least squares fitted gradient of  $21.7^{\circ}\text{C}/\text{km}$ , with a standard error of estimate of  $5.2^{\circ}\text{C}$ .

### (b) Area 2: TWP1-80W2

Figure 5 gives the well locations for area (2) as above, and Figure 6 shows the well locations on the approximate township/range grid.

Figure 7 is a temperature/depth plot of this second area. A temperature gradient of  $25.0^{\circ}\text{C}/\text{km}$  is indicated from the least squares fitted straight line, with a standard error of estimate of  $6.5^{\circ}\text{C}$ .

(c) Area 3: TWP1-90W3

The well locations for this area are given on the Saskatchewan map in Figure 8, and on the township/range grid in Figure 9. Figure 10 gives the temperature/depth plot for all the data in area (3). It indicates an overall temperature gradient for this western part of the province of  $21.3^{\circ}\text{C}/\text{km}$ . The standard error of estimate in this case is  $4.2^{\circ}\text{C}$ .

3. MANITOBA

The Manitoba data have provided temperature information from 631 wells, with 663 bottom-hole temperature values. The well locations from which data were obtained are shown in Figure 11.

Figure 12 gives the well locations on an approximate township/range grid. The wells lie within the area TWP1-60W1.

The temperature/depth plot for all the Manitoba data is given in Figure 13. The wells in this region are shallow. The overall gradient, based on the slope of the least squares fitted straight line, of  $17.4^{\circ}\text{C}/\text{km}$  is quite low. The standard error estimate is  $4.4^{\circ}\text{C}$ . However, the scatter is quite large, for some of the deeper wells.

#### 4. GRADIENT CONTOUR PLOTS

Temperature gradient contour plots have been constructed from the bottom-hole temperature data. To construct the contour plots all data from  $3 \times 3 = 9$  TWP/RGE areas (approx.  $28.8 \text{ km} \times 28.8 \text{ km}$ ) have been plotted as a function of depth. Least squares fitted straight lines have been fitted to each of these plots and the related gradients computed. In some cases, because of the scarcity of data, a regression line could not sensibly be fitted, so a gradient was estimated by hand, based on an assumed reasonable surface temperature. The slopes of the least squares fitted straight lines (or equivalents) give the temperature gradients for the areas. These values were assigned to the centers of their respective areas, and the contour plots drawn.

Figures 14-21 give the temperature gradient contour plots for all the data from Saskatchewan and Manitoba, as plotted on township/range grids.

Figure 14 is for townships 1-30 W1. From this plot, the gradient high in the Brandon area (TWP10-RGE19-W1) indicated by the AAPG results is not apparent from our data analysed in this manner. However, there is a moderately high gradient near the Manitoba, Saskatchewan and North Dakota borders (TWP1-RGE29-W1).

Figure 15 is for TWP 15-44 W1, and overlaps with Figure 14. The increasing gradient trend towards the north-eastern part of Manitoba is based on only a few data points and so should be treated with caution.

Figure 16 gives the contour plot for TWP1-30-W2, Saskatchewan. Our results for the Regina area (TWP17-RGE19-W2) show that Regina is situated between a low gradient area to the west, and relatively high temperature gradient areas to the north and south, in general agreement with Vigrass et. al. (1978)\*. From our data the estimated gradient in the Regina area is  $11.8^{\circ}\text{F}/1000\text{ ft}$  ( $21.8^{\circ}\text{C}/\text{km}$ ). Assuming a mean surface temperature of  $10^{\circ}\text{C}$ , this would indicate a temperature at 2200 m depth of approximately  $58^{\circ}\text{C}$ . The temperature gradient for the Regina area estimated by Vigrass et. al. (1978) was  $13.3^{\circ}\text{F}/1000\text{ ft}$  ( $24.6^{\circ}\text{C}/\text{km}$ ).

Figure 17 is for TWP21-50-W2, Saskatchewan, and overlaps Figure 16. Figure 18 is for the northern part of W2 (Saskatchewan) for which we have data.

Figures 19-21 are for the region W3, Saskatchewan. One feature of interest, and which may bear more investigation is an apparent linear structure which runs northward through approximately ranges 14-18, and is particularly striking for townships 30-55.

\*Vigrass, L.W., Kent, D.M. and Leibel, R.J. (1978). Low grade geothermal project, geological feasibility study, Regina-Moose Jaw area, Saskatchewan. Earth Physics Branch Open File 78-4, Ottawa, Canada.

5. COMMENTS

This report presents a summary of the work carried out during tenure of this contract. The data have been obtained, and some initial analysis carried out. However, we have not had an opportunity to proceed with more detailed work.
